Scott,

Please elaborate on "it does USB". Does that mean it will talk to a GPS receiver that communicates via USB, or only that it will talk to a PC over USB?

Thanks

WS8E

3251. Kantronics KPC3 Pinouts

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-23 14:15:01 UTC
From: Wayne Mikel
Topic: 3251 Message: 3251

Are the pinouts for the 25 pin connector on a kpc3 the same as for a kpc3+? If so am I correct that pin 2 is tx data, pin 3 is rx data, and pin 7 is ground? I'm hooking up an HTX-202, Garmin GPSIII, and the KPC3 for APRS. I have the TNC, Radio and computer seeing eachother, I just need to get the GPS unit in the mix.

google earth (GE): yes you need to figure if it works best in direct x mode
or open gl on your machine besides that i had no problems with it

aprskml no i just followed the instructions and then setup filtering so all
i see is local stations
oh and make sure you have java runtime enviroment installed i almost forgot
about that

direct download for
GE http://earth.google.com/tour/thanks-win.html
aprskml
https://aprskml.dev.java.net/source/browse/*checkout*/aprskml/jars/aprskml.jar

I can't know exactly, but there is a standard for D25 connectors for
RS232, and Kantronics have hardly made a special configuration for one
of their devices.

Yes, the 25w conforms to the RS232 specification for a Modem.

Hi Gervais

I don't know if there's anything you need to do to remote connect to KPC3 or not. Once you connect to it, I think you can send the command UIDIGI OFF.

I hope that helps.

73, Bruce

Well to connect to a KPC3 remotely you first have to have it setup to accept remote control. I _think_ it's turned off by default. When you turn it on you have to pick a password to use with the remote control. Then when you connect to the TNC it gives you the numerical number associated with your password in a jumbled order. You then have to enter your password in the order the KPC3 wants. Example password=letmein after you connect to the TNC it responds with "1465273" ("'s not part of output) and you would respond with "lmieent" ("'s not part of output) to gain access. The next time you try to access the TNC it spits out the password numerical value in a different order to keep unwanted guests out of the unit.

Well STAN

I know how to connect remotely mi digi too admin it,

what i need to know is how to stop the digi so it would be TURN OFF for
a while until i go upthere to repair it.

there was a command on my packet node,CLOSEDOWN N that would put the
node

in a sleep mode if you like so it would not tx,i wonder if there is a
similar command on my digi???

Thanks for your help Bruce and Stan

What about
DIGI OFF
BEACON 0
If it can't DIGI and it can't BEACON isn't it off? Or at least 99% off?

3262. Aprspoint version 3.1 available

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-24 07:31:45 UTC
From: hxc98
Topic: 3262 Message: 3262

Fixed several issues raised by users regarding 3.0, Specifically

1. How the server filter setting is handled,
2. Server report path correction,
3. Position dialog default values,
4. Persisted settings for station and gps tracking,

Thanks.

Hi Gervais

I don't know if there's anything you need to do to remote connect to KPC3 or
not. Once you connect to it, I think you can send the command UIDIGI OFF.

I hope that helps.

73, Bruce

hi bruce
it is a kpc 3 with version 8.2
ve2ckn-3 on the map

gervais,ve2ckn

ps i must stop it,interference problem so when the snow be gone later i
will
go on the mountain to check what is going on!!!!!!!

Hi Gervais

What kind of digi is it? (UI-digi, Kantronics KPC-3, other?)

Thanks

Subject: [APRS] what is the command to stop a digi?

hi
i am looking for the command i would send ,remotely via airwaves ,
to stop transmetting my digi,
i know how to stop a thenet node in packet world but here in a digi,
is it with the STOP command???
i dont have tried anything yet,the digi is far away and on a mountain
so i must not mess things around,,,,,,,,,,,,,,,,,

73/s all
thanks for the help

gervais,ve2ckn
digi ve2ckn-3

I have successfully registered for the APRS KML project and I downloaded and installed Google earth and the latest ver of Java but internet explorer cannot download the aprskml.jar or the images.zip file. It fails every time. Can I get someone to send them to me or give me better instructions as to how to download those two files. Tnx.

Neil,
W4NHL

aprskml no i just followed the instructions and then setup filtering so all
i see is local stations
oh and make sure you have java runtime enviroment installed i almost forgot
about that

direct download for
GE http://earth.google.com/tour/thanks-win.html
aprskml
https://aprskml.dev.java.net/source/browse/*checkout*/aprskml/jars/aprskml.jar

hello guys....

i am brand new to aprs and am using winaprs.
tnc in kiss mode, agwpe, winaprs.

when i input my station set up, all is well. untill i close the application.
when i restart i am forced to re enter all my information.

can anyone tell me how to save at laeast my station information so i dont have to keep re-entering it?

sorry if this is the wrong group for this.....but if it isn't i'd appreciate the help!

thanks!

in order to save any settings in win aprs you have to register/pay for it
and id wait till dayton comes around he usualy has a discount if you pay at
the hamvention

well stan
i tried
uidigi off

it stop partially too tx on the air
it still send his position on the air

i would like to stop tx from the digi but it seems that i wil have to wear
my snowshoes and go over the mountain ,,,a 2 hours ,,,,2 1/2 hrours at
least trip just to go at the radio site

What about
DIGI OFF
BEACON 0
If it can't DIGI and it can't BEACON isn't it off? Or at least 99% off?

3269. RE: [APRS] Re: what is the command to stop a digi?

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-25 16:50:49 UTC
From: Stan - N0YXV
Topic: 3255 Message: 3269

Make sure BEACON is set to 0.
If you have 8.2 or higher you have to change section for GPS. I'm trying to recall from memory but I think it's LT or something like that. In that string you will have a time feature just like the BEACON command. Make sure that's set to 0 as well.

3270. best maps?

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-26 12:39:57 UTC
From: Harold E. Vine III
Topic: 3266 Message: 3270

anyone recommend a best mapping program ect?

using standard tiger maps, but i want something better, something that intergrates into winaprs?

any ideas?

3271. Long trip settings

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-26 13:47:23 UTC
From: Tim Smith
Topic: 3271 Message: 3271

I'm planning a drive from Massachusetts to South Carolina next week and would like recommendations on the best average setting for my Opentracker. I will be driving mostly down I95 and I85 and will be crossing thru metro and rural areas. Is there a setting that will take advatage of the fills as well as the main digis? I will be running about 40 watts with the 1/4 wave whip tucked inside my fiberglass truck cap.

Thanks,

Tim, N1TI

3272. Re: what is the command to stop a digi?

Yahoo group: APRS (1998 — 2006)

From: Chuck Kimball
Topic: 3255 Message: 3272

It really depends on how your digi is setup to begin with, but I'd suggest trying this

UNPROTO %
BEACON EVERY 0
BLT 1 EVERY 00:00:00
BLT 2 EVERY 00:00:00
BLT 3 EVERY 00:00:00
BLT 4 EVERY 00:00:00
UIDIGI OFF
UIFLOOD %
UITRACE %
DIGIPEAT OFF

That should pretty much kill all the transmissions, unless you have something unusual setup in the TNC.

3273. GPS advice please?

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-28 11:48:41 UTC
From: g4kxg
Topic: 3273 Message: 3273

Looking for advice regarding which GPS to use.
I have a Kenwood TMD700e in the car and want a GPS for APRS and/or voice directions.

Questions:-

1. Which GPS units are suitable? (ie which output the required data?)
2. How can I tell which Garmin units for example output this? (specs on websites dont usually say)
3. Would you recommend a separate unit for the APRS (eg Garmin Etrex?) and a larger unit (eg streetpilot?) for voice directions?

Many thanks for your help,

73 Ken

Do you want something portable that you can use handheld, or do you want a permanently mounted unit? Do you need mapping? I've heard good things about the Garmin 276C, and I understand it has voice output.

For portables, I'm fond of my Garmin GPS 60cs. The eTrex and Geko series are good for small, inexpensive handhelds.

If you want something headless, I'd suggest the Deluo GPS WAAS or Garmin GPS 18, both of which I stock (www.argentdata.com/catalog). For a D700 that's permanently mounted, you might as well get one of those (the Deluo is only $58), mount it someplace secure and out of the way, and not have to worry about connecting and disconnecting a shared unit. I don't have a D700 myself and don't know what the connector pinout is, so you're on your own there.

Just about any GPS receiver that isn't USB-only should work for APRS. I don't know of any common units that have serial but not NMEA - the old Earthmates come to mind, but that's about it.

Here is a GPS well suited for APRS operation with Kenwood radio.

Available from Memphis Amateur Electronics Inc.
http://www.memphisamateur.com/index.asp?PageAction=VIEWPROD&ProdID=790

Avmap G4T (Geosat 4)Navigation system for APRS
serial interfacing to Kenwood TM-D700A & TH-D7AG with full bi-directional capabilities allowing call sign display (WPL) on the GeoSat screen
AvMap is working with Kenwood to have a Kenwood ready cable included out of the box solution for APRS
http://groups.yahoo.com/group/Avmap_G4T

Hi Scott - something like the Deluo looks like it could be a good
option. I assume it outputs NMEA data?
Would this unit have to go on the outside of the vehicle?
Also is there a power lead available to use the cigar socket?

Connections to the Kenwood look fairly simple. A 2.5mm 3 conductor
plug is used.
tip goes to Data in on GPS
centre goes to Data out on GPS
Shield goes to GND on GPS

This sounds to me like it could work and a good option.

Wonder if anyone else on here has used one of these?

Yeah, it's NMEA. I run one on the rear deck, underneath the tinted rear window, and I've never had any problem with it losing lock. I've also used them on the dashboard, and stuck under the moon roof.

I've got some 8.5 volt cigarette lighter adapters, and the old Deluo units were rated at 9 volts max, but the new ones just say 5 volts so I wouldn't push it. Deluo sells a cigarette lighter adapter which I don't carry yet - you can get that directly from www.deluoelectronics.com.

I need to remember to order some of those 2.5mm connectors - I've only got the mono type on hand, and these days you can't count on your local Radio Shack stocking anything.

You could also check on APRS SIG for input about the Deluo units - I know tons of people are using them, probably quite a few with the D700.

3279. What am I doing wrong?

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-29 22:52:21 UTC
From: Wayne Mikel
Topic: 3279 Message: 3279

I have a Radio Shack HTX-202 hooked into a Kantronics KPC3 (not plus) and a Garmin GPS 3.

The radio is picking up 144.390 just fine and giving the information to the TNC just fine. When I hook in my laptop and look on UI-View32 it shows up all the heard stations and beacons my position to the system.

When I add the GPS unit in it essentially stops the whole thing. I get no waypoints from other stations or objects and no one sees me on their system.

The GPS is set to NMEA 4800baud and the TNC has been switched from host to none to kiss modes and nothing happens.

I'm going from the gps into the tnc and the radio into the tnc.

I have checked the gps wiring and have reversed them to see if that was the problem (It wasn't so I switched them back)

I'm open to any suggestions.

PLEASE HELP ME!!!!!

Wayne KE6DJE

I'm no expert, but I see that no one else has responded. I just went through a similar discussion on the California APRS group and thought I'd share what the experts there told me. "WIDE2-1,WIDE2-2" is supposed to be the best choice to avoid channel congestion and get yourself out there.

3283. Fill in APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-30 13:15:34 UTC
From: Rob
Topic: 3283 Message: 3283

I am setting up two new KPC3+ v9.1 for Fill in
Digipeaters in Western Ohio (Miami and Shelby
County?s). We have several areas that are below the
average height of the terrain in this area and several
hams around with less than 5 watts can?t be seen by
the Digis or I Gates in Dayton (12 to 30 miles away).

I would like to know what would be the best Widen-N
for fill in, and not be congesting the system. All
other settings I am using are the ones found on Bob?s
web page
http://www.ew.usna.edu/~bruninga/aprs/kpc3+WIDEn.txt
I am also considering using the SSn-N

Thank you
Rob WP4YJ /8

I'm pretty new at this aspect of the game, having just set up an Igate at home (which I still need help with, anyone running WinAPRS 2.8 as an Igate, contact me!).

I think you'll be okay with Bob's recommendations, but maybe Wide 1 instead of 2? All I know is to set them up and try it, and hope that folks don't send a lot of text messages in the APRS strings. :-)

Perhaps you meant to type WIDE1-1,WIDE2-2 ???

There is no advantage to WIDE2-1,WIDE2-2 over using just a plain WIDE3-3.

WIDE1-1 is the new replacement for RELAY and invokes the fill-in digi's and
home stations that are properly setup. Only use it in the first position in
the path.

Best mobile path: WIDE1-1,WIDE2-1
(You don't really need 3 hops anymore in most areas of the country)

Best Home station path: WIDE2-2
(In the rare case that your home station cannot hit a WIDE digi directly and
you need the help of a fill-in station then use the mobile path)

Been discussed ad-nauseum on the TAPR APRS sig.....

Not Bob, but.....

A path of WIDE2-2,WIDE1-1 (for example) will go out two hops using only the hilltop WIDE digis and then it will key up every fill-in digi and home station within earshot of those final wide digi's. Which could be a very large number of stations. And is completely unnecessary because all those home stations, and presumably any other stations nearby, already got the packet from the WIDE.

Same issue that existed with a path of WIDE,WIDE,RELAY or WIDE3-3,WIDE2-2,WIDE1-1 although I have seen those in use.....(sheesh)

Paths work from left to right, just like you read. The digi's don't look all the way through the path to decide if there is something in there they need to act upon. They only look a the next "unused" part of the path statement.

Ron, thank you very much.
I have learned something new today.
I did not know that it was (I may say this the wrong way) execute instructions left to right!

I had undurstood that if a station had Widen-N that Widen-N was a way to identify the station (since it is not connecting station to station like in regular packet) and get the data then do what it neede to do with it (i.e. Digi, IGate etc)

Thanks
Rob WP4YJ /8

P.S. and Bob WB4APR, you don't have to reply HiHi

Happy to be of some help. And, don't feel bad.....many people seem to not realize how the paths work!

Remember, this is just packet radio. It's been "prettied up" with GPS locations and maps but it's still just regular packet, with the exception that you don't actually "connect" to your destination station. You still send a packet to a destination address (APRS) and you use aliases (WIDE2-2,WIDE2-1, etc) to specify the routing. All the digi's are doing is decrementing the -N of the WIDEn-N aliases to control how many hops you get. WIDE2-2 gets changed to WIDE2-1 after the first hop, and then changed to WIDE2 after the second hop. It's used up at that point and will not get digi'd any further.

There are other things going on behind the scenes also, but that's the basic principle.

Here's a great website to poke around on. Lots of info.

Yeah, I've seen that page before, and I'm familiar with APRS-IS, but I'm interested finding a list of stations that transmit satellite pass information that I can receive on my TM-D700. According to the image on Bob's page below, there were lots of stations doing it at one time, but apparently they aren't now. There's nothing on the aprs-is site about that.

3296. RE: [APRS] Fill in APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-31 05:20:26 UTC
From: Stan - N0YXV
Topic: 3283 Message: 3296

Fill in digi's should be set to WIDE1-1. WIDE1-1 because all you want to do is forward the packet to the higher Wide area digi's. But really the best answer to your question is ask the Wide area digi operators in your area for the BEST recommendation. Every area can be a little different. If your running an IGate you'll want to talk to the other Digi or IGate operators as to how to setup the IGate. My experience has been that if you have _any_ IGates even close to you you'll want to make sure that you don't IGate _any_ packets to RF. Any IGate is helpful if it's excepting packets from the RF to the internet but can cause problems if allowed to do the reverse.

3297. RE: [APRS] Re: APRSdata servers

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-31 05:41:36 UTC
From: Stan - N0YXV
Topic: 3293 Message: 3297

I _think_ what it's referring to is stations that take the downlink from Satellites and retransmit it to APRS-IS. As far as these servers don't have a Transmit Frequency (other than the Satellite uplink frequencies) that they transmit on. Since your not supposed to do unattended Satellite uplinks these unattended servers probably don't transmit on any frequency but simply receive data and pass it on to APRS-IS. As an example I have an APRS station that scans several Satellite downlink frequencies and captures that data then passes it on to APRS-IS. My Satellite Server doesn't transmit on any frequency since it's made just to receive.

As far as setting up your TM-D700 to use that system you would set it up for one of the Satellite frequencies and try to bounce a packet off the Satellite that would then get down linked into the APRS-IS via one of the Satellite Servers.

I hope I answered the question you asked. If I did you can find more at

http://eng.usna.navy.mil/~bruninga/astars.html

Ok I'm going to assume you mean on 144.39 and in that case I'm with you I'm not aware of any doing that.

By the way sorry for sending the URL you already posted. It's getting way too late here....time for bed.

3299. Re: Fill in APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-31 12:57:02 UTC
From: Robert (wp4yj)
Topic: 3283 Message: 3299

Ray and Stan, thanks for your comments.
I found (after a few hours) Bob WB4APR section on fill in digi.
I do have a better understanding of what we have to do.

As for the IGate, it has been operating for over a year and we have
filter string to accept only a certain lat and lon as for internet to RF.

Thanks
Rob wp4yj /8

3300. RE: [APRS] Re: Fill in APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2006-03-31 14:21:51 UTC
From: Stan - N0YXV
Topic: 3283 Message: 3300

While your filter is a great idea it doesn't completely address my concerns. Lets just imagine for a minute that there are 5 IGate's within X range of each other. All can here each other while they all know that there are 4 other IGates (5 minus themselves = 4) they don't know what all the other IGates can do. So lets assume for the sake of my point that they all are set to IGate Internet => RF. Even if everybody uses a filter the filters would more than likely overlap. At least the RF patterns overlap so I'm assuming for now that the filters setup would too. Now just picture a packet from the internet that makes it through all 5 filters. All 5 machines see the packet and begin to broadcast. Wow lots of packets flooding the network and none of them get through.

If you take the example and expand that out a little bit and say that the IGates can't see each other via RF but they can see each other through at least on Digi. Now imagine what happens when all 5 IGates begin to transmit packets. WOW talk about a potential packet storm.

Now my example does assume that the IGates can all transmit at the same time and that they aren't doing dupe packet checking before transmitting but I'm trying to explain the worst thing that can happen so you'll at least see my point.

When ever anybody sets up an IGate or Digi you _really_ need to check with the local Digi and IGate operators to make sure what you are doing fits with the plan for the area. If you don't have a plan for the area you might want to get all the local APRS users together and make a plan. Coordinated APRS works really well on the other hand uncoordinated APRS can flood a 1200 baud network.

What if you're the only Igate in the area? Does that mean I get to set up my own rules? :-)

As long as you follow the new WIDEn-N Paradigm I don't think anything else would matter much in your case. :-D I guess I was just trying to be as generic as possible since a lot (ok maybe just a few) people read this Yahoo Group. In your case you might even (probably already have) consider being both a Digi and an IGate.

3303. Kenwood D7 serial computer cable

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-01 03:15:11 UTC
From: Rasputin Novgorod
Topic: 3283 Message: 3303

I tried to make my own Serial cable to connect the D7
to a computer for programming. The manual gives the
wiring pinout. No matter what I do, I cannot connect.
I can connect using my friend's computer and Manufacturer's
cable.

I've been told the serial cable cannot be cloned because
there are additional parts hidden inside the molded plug,
making it propriety.

Has anyone successfully made a cable?

Sincerely
Blair

Blair:

I made one and it works great. I used the drawing in the D7 manual. There are no parts hidden in the hood, just the three wires. D7 does not use level converter, just plain old rs232.

At first I had a problem in trying to solder the wires. This is using the cable that come with the radio. Once I figured out why it was not taking solder, the problem was licked. If that is not your problem, try to reverse pins 2 and 3. Look for the most obvious!

Ditto - no trouble building a cable myself. I even started carrying the right angle stereo cable...

http://www.argentdata.com/catalog/product_info.php?products_id=29

Beats the $20 MFJ wants for an OEM one. Just needs a DB9 soldered on. And a ferrite bead wouldn't hurt.

I think the eMap should take 9-digit waypoints. If you set it wrong, no harm done... it'll just say 'invalid waypoint received', and you can try a lower setting.

I think you're thinking of the D700 - it takes a straight-through serial
cable with females on both ends:

Argg...

I've tried everything and can't get it to work.
Followed the drawing in the book, tried null modem,
tried reversing pins 2 & 3, checked w/ ohm meter...

Does the radio have to be set into a special mode?
Suggestions?
Thanks

/Blair

No, the radio does not have to be in any special mode. It just has to be ON.

Maybe it is time to look outside the box? If you are 110% sure that the cable is good, have a ham friend check your work and readings of the constructed cable. Next, try to eliminate the software by downloading and reinstalling again. If that fails, try this on another computer or a different com port if it has more than one.

If all this fails, let me know and I will loan you my home constructed cable to make the test of your hardware and software.

Well, I made a second cable to go from the D7 to
the GPS and it works fine, so I'm going to blame the
computer for problems with the first cable. I'll try using
another computer. Thanks everyone, for your help.

Sincerely
/Blair

If the cable you made for the GPS has a DB9 on the end of it, you can use that same cable for communications with the PC...just add a null-modem to it.

If you have a cable that will work to connect a GPS to the D7, a null modem added to that cable will work to connect the D7 to a PC...I have mine connected to my laptop with just such a cable right now.

3317. Re: Kenwood D7 serial computer cable

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-02 21:24:05 UTC
From: KC2MMI (Jared)
Topic: 3283 Message: 3317

Blair, the cable you made that was no good? Was that using the OEM cable that Kenwood supplies which "just" needs a DB9 added to the end of it?

I ask because a number of folks have reported getting bad cables from Kenwood, apparently sometimes the wires are internally not attached or broken, just poor quality control. If that's what you got--contact Kenwood and ask them for a replacement.

You can take one cable and put both a DB9M and DB9F on the end of it, reversing pins 2/3 as appropriate. Then you've got one cable that fits both GPSes (one plug) and computer serial ports (the other plug).

3319. Getting started with a FT-817 and xastir APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-03 04:55:24 UTC
From: lynnmonsanto
Topic: 3319 Message: 3319

Hi all,

I apologize (!) if you get this more than once, since I'm posting this to four (!) different groups, hoping someone can get me started with xastir APRS and my Yaesu FT-817. Please don't reply back to all four groups, so we don't get a flood of cross-postings!

I used Darwin Ports (http://xastir.darwinports.com/) to download, build and install the xastir APRS software (http://www.xastir.org) on my Apple iBook, which has Max OS X 10.4.5 installed.

xastir starts up okay. I configured xastir with my home GPS coordinates, and the map shows my location correctly.

My FT-817 is connected to my iBook using a KeySpan serial adapter. The FT-817 is also connected to my Kantronics TNC. I added my serial TNC (/dev/tty.KeySerial1) from the xastir Interface Control dialog. Here's were I need some help:

1. I set Port Settings to 9600 bps, which is the same as my FT-817.

2. What Port Style should I use 8,N,1 or 7,E,1 or 7,0,1 ???

3. What are IGateOptions and UnProto Paths ???

4. How should I configure my settings on my FT-817 ???

5. How do I test to make sure I have everything right?

Any help would be greatly appreciated!

Thanks and 73!

3320. problems with TNC-X

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-03 21:03:52 UTC
From: andy_watson5
Topic: 3320 Message: 3320

I've got a TNC-X (from John Hansen http://www.tnc-x.com/) that I've
been using for awhile. Lately I notice that there seemed to be less
APRS traffic on my UI-View screen. Then I realized that my TNC-X
isn't decoding about 75% of the packets. I thought maybe it was a
problem with my radio or antenna, but then I connected the audio
output from my TM-D700 to the TNC-X, and sure enough, the D-700
decodes every packet, but only a few ever show up on my UI-View
terminal. Anyone have any ideas as to what the problem might be?

From: jan_t_p
Topic: 3322 Message: 3322

I have established a new APRS networking discussion group, as a follow-up of some discussion rounds and a poll in the UI-View group.

I understand that list owner Ray would like to keep the APRS list as a beginner's list and not include such advanced network setup discussions as we have had from time to time in the UI-View discussion list; a new group seems to be a way to have a forum for such matters.
So if you wish to discuss network design, you are welcome to subscribe to a non commercial, English language email group provided by radio amateurs, for fellow radio amateurs, dedicated to discussions about the design of APRS networks, setup of APRS digipeaters, and practical path settings for users.

Subscribe by sending an empty message to
<mailto:aprs-net-subscribe@...>

or visit <http://uk.groups.yahoo.com/group/aprs-net/>

I hope that such a list can be a good place to discuss that sort of items.

Hello everyone
My name is Jeff I live in Phoenix,Az
I am new to this list.

I have a question. I have noticed on findu.com
that it copies any messages sent-received from the Kenwood D-700 OR UIVIEW
anyone know how to prevent this? or erase them?
I have sent a message to the guys as findu.com
and have not received a response in over 2 weeks.

Hi Jeff;
As soon as you have sent a message from any APRS system to destination
APRS (which is the default), it can (AFAIK) not be prevented from
entering the Internet at some place and then be shown at Findu.

If you put RFONLY in your path, it shouldn't be gated to the Internet. Other than that, I don't know of any way to keep it out of the databases like Findu and aprsworld. Anyone can hook up to the APRS-IS stream and log data, and you just have to assume that anything that makes it onto the stream will be archived forever someplace.

Mike,

Not sure what the problem is with smart beacon, I have three TT3's and they work just fine.

The KPC-3+ is a very good TNC. If you can use a TNC with just a KISS interface the TNC-X is a very good one to use.

3335. What am I doing wrong

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-06 03:02:29 UTC
From: Wayne Mikel
Topic: 3332 Message: 3335

I'm running the following setup and I'm not getting anything to or from the GPS unit. I'm not seeing any waypoints show up. it's getting me frustrated. Please look at the following and see if you can see where I went wrong. The radio connects to the TNC with a factory cable. when I hook the computer up the radio/tnc/computer communicate just fine. When I take the computer out and add the gps instead then it doesn't seem to work. I don't see myself show up on UIView32

Do you switch the KPC3 into GPS mode? If you use the TNC with a computer the computer does the BEACON etc. When you use it as a tracker without the computer you have to switch from command mode (or KISS if your using KISS) to the GPS mode inside the KPC3.

Check out PacComm's PicoPacket 2 port, very small size of a pack of cigarettes, computer inoutput
RS232, input for gps and Radio very good TNC for mobile hook up with computer or stand alone unit. Have been using mine for about 4 years mobile great TNC.

Hello to the groups,

I am having difficulty making my KPC3+ beacon data. I feel sure it is a configuration problem.

All help appreciated

Thanks,

From: kf4nnq
Topic: 3340 Message: 3343

You have to provide more info. Do you have a reliable TNC-to-radio interface? Can you connect to your KPC-3+ with your PC?
I'm guessing you already know how to update the BTEXT and BEACON fields.

From: kf4nnq
Topic: 3332 Message: 3344

Also make sure you have a null modem between the GPS and TNC serial
ports. I went for a while once being able to see the GPS on my PC
and being able to see the TNC on it as well. I forgot they were both
using the same tx and rx pins to talk to the PC so they didn't talk
to each other when connected together.

3345. APRS remote control

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-08 02:04:09 UTC
From: acentient_software
Topic: 3345 Message: 3345

Acentient Software has just released a new general purpose home automation program that can report to and be controlled via APRS short text messages.

This new application allows you to monitor / control your electronic devices interfaced to your computer or even your entire home via the APRS network.

In addition the software has many other advanced features including Scheduling / Conditional Events, 2-way Speech, Digital I/O, Serial Com Port Data, Sun rise/set time + more!

For more information, please visit:-

http://www.acentient-software.com

Steve,

I got this working last night. After two weeks of checking, rechecking and checking again, I discovered I had set the KPC3+ to look for the NMEA string $GPsMC instead of $GPRMC. Since $GPsMC is an invalid string, no data was being stored, hence, none being beaconed either.

Thanks for the reply,
Kim, K3OCM

3347. TEXT messages in APRS

Topic: 3347 Message: 3348

If you mean text messages to other APRS users the answer is yes. Most of the APRS programs I've seen allow for text messaging. Your question leaves me wondering what prompted the question? Hope I understood it correctly.

3349. Re: [APRS] TEXT messages in APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-09 02:15:32 UTC
From: jeff daugherty
Topic: 3347 Message: 3349

What I mean is if you send a text message from your D-700 to another user on a D-700. that message will not only get sent to the other radio BUT also
will make and store on the internet... if you pull up W0NWA* using www.findu.com

you will see two astrics (**) next to messages.
if you click on this you will see any messages I have sent with my kenwood d-700 as well as UI-View.
how do I erase these that are stored? why are they stored?
I have let more then 10 days go buy for the call to purge from the system but as soon as you use it again the messages are back with it... seems like the do not disappear!!
I have wrote the guys at www.findu.com
and have not received a response

3350. RE: [APRS] TEXT messages in APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-09 03:26:49 UTC
From: scott@opentrac.org
Topic: 3347 Message: 3350

You can't erase them from Findu's database, and there are others (aprsworld, openaprs) that store them indefinitely as well. If you add RFONLY to your path (e.g., WIDE2-2, RFONLY) then your packets shouldn't be gated to the Internet. That'll also prevent your position from showing up online as well. I don't remember if the D700 has an option for a different message path.

If you're sending a message that has to go through the Internet to get where it's going, then you're out of luck. Just like any messages you post publicly on the Internet, you have to expect they're going to stay around forever. There's no concept of private messaging in APRS.

That's the way it is...
You don't really send it to another user, you send it unconnected out in the world, and hope that the "another user" you meant it for, will receive it. He or she may or may not receive it; chance is that it also is picked up by an APRS station connected to an APRS-Internet Server, and then the message is found at findu.

Interest prompted the question

I am in Florida. I was curious if a message to Maryland would be
possible through the APRS system.

From: scott@opentrac.org
Topic: 3347 Message: 3354

Absolutely, as long as both parties can reach Igates and vice versa. When your outgoing message hits an Igate, it's passed to the APRS Internet System. All message-capable Igates in the world see it, check to see if they've heard the destination station in their area, and if so, pass it back to RF. Same for the return path. If both of you regularly show up in FindU, you should be able to talk just fine.

3355. RE: TEXT messages in APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-09 16:20:26 UTC
From: Kim Wells
Topic: 3347 Message: 3355

Scott,

How does one do it? Software or the BBS mode in the TNCs?
How does it get addressed?

Thanks,
Kim, K3OCM

3356. RE: [APRS] RE: TEXT messages in APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-09 16:25:18 UTC
From: scott@opentrac.org
Topic: 3347 Message: 3356

I don't know of any TNCs that support it directly, but that's something I'll have to add to my to-do list for my new tracker/TNC. You could actually type APRS messages in converse mode, but it'd be a little tedious - you'd have to get the format exactly right and handle acknowledgements yourself.

Without a PC, you can send APRS messages using a Kenwood TM-D700 or TH-D7, or the HamHUD. There might be some PDA-based options too. With a PC, you can use pretty much any APRS client. I use mostly Xastir (on Linux) and UI-View32 (on Windows) myself. You just enter the destination callsign and type in your message.

3357. what dual band mobile rig to use with tracker?

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-10 05:28:27 UTC
From: andy_watson5
Topic: 3357 Message: 3357

I'm thinking of buying a new dual band radio to use in my vehicle along with an APRS tracker (TinyTrak or Opentracker). I'd like to be able to use one side of the radio solely for the tracker, but still be able to RX and TX local voice repeaterson the other side. I know the Kenwood D700 will do this. Are there any other radios capable of separate packet and voice operations?

3358. Re: [APRS] what dual band mobile rig to use with tracker?

Yes! The best option (I think) is the Icom IC-2720.
I own one and its great for this very reason. You can
dedicate one side to packet while maintaining voice on
the other side. The 2720 also has the standard
Mini-Din packet port on the back to support 1200 and
9600 baud packet.

BTW, YES, there were problems with this radio early on
with 2M finals going out and other minor issues. It
seems that Icom has cured many, if not all problems.
I have yet to have a problem out of mine. But, I did
gather that most of the guys burning theirs up were
using the full 50W to long-wind on the local
repeaters. As we all SHOULD know, maintain
communication with the least required power. That
guideline seems to have faded over the recent years.

Oh well, just my $0.02

Yes, that is what findu.com is for. Archiving APRS traffic and allowing
people to access it from the Internet.

> how do I erase these that are stored?

You don't.

> why are they stored?

So we all have a permanent record of APRS traffic.

> I have let more then 10 days go buy for the call to purge from the system but as soon
> as you use it again the messages are back with it... seems like the
do not disappear!!

If you don't want your APRS messages archived the only real solution is
not to send them in the first place. Once it hits the air its fair game
for anyone who can receive it direct over the air, over the Internet in
real time, or from an Internet archive.

> I have wrote the guys at www.findu.com and have not received a response

If you sent a message requesting your messages be deleted, they probably
laughed, said "what an idiot" and deleted your message. Don't hold your
breath waiting for them to go away.

3360. Rand McNally 1225B-R1 GPS ??

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-10 19:28:35 UTC
From: Bill Reid
Topic: 3347 Message: 3360

Does anyone know what the supply voltage is for this GPS. I bought it used a while back and it worked fine but recently the cigar lighter source died.

I'm not sure if it is a 3V ,5V or 12V feed. I'm guessing it's 5V , but just want to be sure. If anyone has a manual, I would appreciate a copy.

Thanks in Advance
Bill

Pardon me ... But the D700 IS the radio for you !!

Why buy a seperate tracker unit AND a radio? I have two of them I use one at home, One
in the car, and a D7a for hikeing out and about.

I guess I'm just bias..:)

Actually, I already own a D700. But I also have 6 TinyTraks and 3 vehicles, so I was hoping to put some slightly cheaper rigs in a couple of my cars with trackers. But you're right, the D700 is an awesome radio. The only thing I don't like about it is that it doesn't do SmartBeaconing.

Andy

3363. Kenwood D7 and bigger screen GPS?

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-11 03:45:08 UTC
From: Rasputin Novgorod
Topic: 3283 Message: 3363

Hi All:

I have a Kenwood D7 and an Garwin eMap that seem
to work well together. Infact, I was surprized
and delighted to discover that the D7 was able
to not only beacon me, but also paste received
beacons into the eMap.

It made me wish the screen was bigger. Can anyone
suggest a GPS (preferably Garwin so I can use the
same maps), that has a bigger screen, works well
with the D7 and won't bankrupt me?

Sincerely
Blair VE3CZY

3365. Anyone tried tiny trak with a Motorola GM300?

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-11 17:34:55 UTC
From: Dakota Summerhawk
Topic: 3364 Message: 3365

I was looking at the back connector on the GM300 and noticed that the connection that I use for my SVR-200 repeater could also work for the tiny trak?
I found the information here:
HYPERLINK "http://www.batlabs.com/gm300.html"http://www.batlabs.com/gm300.html

I was curious as I have two of them that are VHF and could if it worked put one in the car and use it for APRS.

Or should I just wire tiny trak through the mic connector?

Ideas?

Thanks

Dakota Summerhawk

After looking at some GPS (bigger screen) pricing,
I'm going to opt for a used laptop with my D7...
A little awkward to use when mobile, but a nice big
screen (and lots of features).

Sincerely
Blair

Blair...

I'm not sure where the bankrupt threshold is for you, but I just ordered one of these to make using the laptop in the car that much easier: http://www.ram-mount.com/nodrillsystems/rampodiii.htm. Trying to use a computer on the passenger seat, or in the passenger footwell with a wireless presentation device for a mouse, just doesn't work. I've tried both. ;)

Not the right Blair, but.... I'm gonna have to get one of those. I've been thinking about building some kind of plywood gizmo to hold the laptop when I go out foxhunting. Although I don't have APRS yet, I do have an eTrex Vista which I connect up to the laptop to keep trak of where I am and use the drawing features on the mapping program to record the signal bearings. However, that gadget looks soooo much better. Thanks for the link!

From: kb6nyu
Topic: 3283 Message: 3373

In my opinon, a notebook-PC is a much more flexible, and cheaper solution.

In case anyone is interested, I'm an authorized dealer for JottoDesk mounting solutions for in-vehicle/notebook computers. I can offer a mounting system that's custom-fit for a variety of vehicles, and the mounts are widely-accepted as a much sturdier than the other well-known offerings.

I've personaly used a notebook-pc and APRS with this arrangement in my vehcile with great sucess.

Please contact me directly, if interested, for further info.

Nice site(www.hamwiki.info). I guess I like the http://info.aprs.net a little better just because it's completely dedicated to just APRS information. The goal of the info.aprs.net site is to have a one stop shop for Newbies just getting into APRS. There are several great APRS sites but as a Newbie you have to a lot of Googling to find it all. What if you had one site you could tell somebody....go here and get it. If you have some information on Hamwiki that's specific to APRS you might want to copy and paste it from one site into the other.

3380. what happened to ariss.net?

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-19 02:36:23 UTC
From: andy_watson5
Topic: 3380 Message: 3380

Up until last week, http://www.ariss.net was a page that showed the most recent stations heard by the ISS, along with maps. It was quite helpful, but now that link just goes to the main findu.com page. Anyone know what happend to it?

Its not so strange. Just a DNS setup error on their part... Unless the split is intentional. As far as the network is concerned www.whatever.com and whatever.com are separate entities. Most people tend to set them the same, but it isn't a requirement.

Rick

3384. APRSPoint new version (3.2)

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-24 10:07:00 UTC
From: hxc98
Topic: 3384 Message: 3384

This version has several improvements on interface and fixed a few problems raised by users, mainly

1. Connect TCP dialog now remembers all servers, ports and filter strings user enters,

2. Added support for auto GPS connection at startup,

3. Improved handling for station tracking and track line customization,

4. Fixed a bug in weather station data processing,

Newer APRS symbol set support is planned, once we have mappoint 2006 and know more about its API interface. Again, visit http://www.aprspoint.com for further details and download of the latest version. Thanks.

> Anyone built a y-cable to use computer and tnc with gps?I would like
> the pinouts.Thanks
>

Yep. Just send the Data Out from the GPS to both the TNC and computer with a plain Y connection. But, and this is important, only one of the two devices (TNC or computer) can be connected to the Data In on the GPS. Do not connect both together. You must decide which device you want to be able to talk to the GPS.

In my case, the TNC (actually my Kenwood D700) listens to the GPS data stream (GPS Data Out) only and has no connection back to the GPS. My computer (a pocket PC running Street Atlas) also listens to the GPS Data Out but is connected to the GPS Data In so that I can command the GPS.

So the pinout would be:

```
GPS Data Out ----- TNC (shared connections)
\---- Computer

GPS Data In ----- Computer

x---- TNC (no connection)
```

3387. No APRS stations in my area .. how do I create my own?

Yahoo group: APRS (1998 — 2006)
Date: 2006-04-28 00:32:32 UTC
From: Bruce Bonbright
Topic: 3387 Message: 3387

I live in an area (Leeward Coast Oahu, Hawaii) that doesn't have any APRS digipeters nearby. I have UI-view running fine on my home base and my station shows up on find-u. I'd like to be able to use my handheld with my TinyTrak TNC with GPS to communicate with my base station and have it report my mobile position via the internet (again since no other APRS stations in my area).

How to I configure UI-View and my TinyTrak to do this?

Any help is greatly appreciated.

hi

well some month ago someone sent me an email with a link that describe me the Wide new set up,,,

it was an animation where you could see your position sent by station,Relayed and receive by a igate,,,,i think.

it was simple and lear as water,,,,,,

anyone knows where i could fiind it??

i had to rebuild my pc and lost all my bookmarks

thanks for the help,we have a demonstration tomorrow about APRS and we need this animations,,,

Seems to me that you need to configure your UI-View to run as a IGATE to receive your TinyTracker/GPS/Handheld signals. The IGATE would help a bunch of others with their APRS portable units. I have a OpenTracker unit that was fairly easy to configure - worked, but I had the wrong handheld. Bought a Kenwood TH-D7A - just add GPS and it works fine - don't need the OpenTracker anymore. Anybody need a OpenTracker?

Since we don't have digipeaters around here - mid SD, I am planning to assemble a local IGATE that will serve me and others in the area. My use will be for aircraft - about 80 mi range to an IGATE without digipeaters. AFAIK an APRS IGATE needs a (cheap) computer, receiver radio, TNC and an antenna and live connection to the internet. Anybody else comment on this?

I'm pretty well doing the same thing here in Joplin, MO... there's some APRS traffic in Springfield, MO, Tulsa, OK, and far NW AR, but none here. So I went ahead and bought the WinAPRS and set up my Igate here.

If you're really the only one in the area, then put up the tallest antenna you can spare. I'd love to put up something taller, but I've been copying mobile traffic up to 30 miles away. I imagine they're running 30 to 50w, though. Lots of trucks and cars on I-44, between St. Louis and OKC. :-)

If anyone has any suggestions for me, fire away.

Ray

3392. Does anyone have any luck with the USB TNC?

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-01 05:06:32 UTC
From: Dakota Summerhawk
Topic: 3392 Message: 3392

I found the USB TNC on a webpage and wanted to hear from people that are using it with WINAPRS. Does this TNC work with WINAPRS? I am wanting to hook it into a GM300 from Motorola either by the front mic or the back. I am thinking that the connection would be better from the front as the pinout for the mic is easier than the back. But some feedback from anyone that has used this TNC would be nice.

Thanks

Dakota

Do you mind giving some details of your IGATE setup.
1. Which radio/TNC are you using
2. What WinAprs files together do you need -
there is a collection
of WinAPRS files available for download from
ftp://ftp.tapr.org/aprssig/winstuff/WinAPRS/
but I don't know which are the files necessary for
the Igate only to send to findu.com

3394. ok to digi yourself?

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-01 14:27:37 UTC
From: Robert Johnson
Topic: 3394 Message: 3394

hello everyone,

I am wanting to run aprs mobile. My setup is a htx-202,tinytrac,50 watt amp,and 2 meter 5/8 wave antenna nmo mounted. My home base setup is running ui-view with a aea packratt 232mbx tnc. I have no problems running 5 watts at home to get me to show up on the internet using the base antenna. There is little or no activity in my area. Still on dial up for internet. The closest digirepeater shows to be 45 miles away. (w4tl-3). I still manage to make it from 1 to 5 times to the internet on my drive in to work. Its always the same high points in my route. Its not a pretty track. I run wide 2-2 in my path. My question is, would it be ok with my tnc set it up with commands digi on and mfrom ke4gvx in my path to only digi me. I don't thing the tnc will recognize wides. I would not be at home the times digi is on, I would have no way of controlling the tnc and radio. I watched aprs packets alot and see a couple of people using their own callsigns in there path. Do you think this is alright?

Thanks, Robert ke4gvx

While the TH-D7A has a built-in TNC, it's not a real good one. For a more-or-less permanent APRS base station, why not go with something like a Kenwood TM-G707 and a KPC-3?

<snip>

I'd suggest setting up MYAlias RELAY on the PK-232, then set your TinyTrac to
UNPROTO RELAY,WIDE2-2

That should get you bouncing off your home digi, and any other RELAY that may
be set up, as called for in the APRS Protocol.

Help me out here. Unless your talking about European settings RELAY was phased out some time back. See this link

http://eng.usna.navy.mil/~bruninga/aprs/fix14439.html

for more information update. Correct mobile settings should be WIDE1-1, WIDE2-1. That would give you a three hop path that should get you almost anywhere you need to go. That's also assuming that all the Digi/IGate operators in your area have also read the above link.

P.S. All uses of TRACE and anything above WIDE5-5 have also been phased out.

You mightn't be aware that in north America, the local/"fill-in" digi
now should have the MYALIAS WIDE1-1 rather than RELAY (since a year
ago). Hence, the tiny trac should have UNPROTO WIDE1-1,WIDE2-2 (or
WIDE1-1,WIDE2-1 in areas with good digipeater coverage)
>
>That should get you bouncing off your home digi, and any other RELAY that may

Many other previous RELAY digis will now respond to WIDE1-1 but not to
RELAY.

To get my 232mbx tnc to operate like a digipeater are the
following commands all I need to add to the command list

MyAlais wide1-1,wide2-2
Digipeat on
Dwait 16

on tractrac
does digpath=unproto ??? when programming tractrac

Digi Path: wide1-1,wide2-2

I don't really trust my $50 hamfest laptop to run all day .
I do trust my tnc and radio to work all day. I was hoping
just to build a command parameter file and save to the tnc
and leave the jumper in on the tnc and turn the laptop off.

Subject: [APRS] Re: No APRS stations in my area .. how do I create my own?

Do you mind giving some details of your IGATE setup.
1. Which radio/TNC are you using
2. What WinAprs files together do you need -
there is a collection
of WinAPRS files available for download from
ftp://ftp.tapr.org/aprssig/winstuff/WinAPRS/
but I don't know which are the files necessary for
the Igate only to send to findu.com

>how to program the KPC3+ for a position. I want enter the lat and
>long to have a fixed digi. Right now it is beaconing dashes.
>thanks

I take it the KPC3 has some BTEXT setting.
BTEXT should be changed to your position and symbol.
You should take a look at some packet from an APRS station and write
your BTEXT according to that, but with your own position. A symbols
chart will tell you which characters to enter with the position in
order to be seen with the symbol appriopriate for your situation (e.g.
Home VHF station is /-). Here is a position string for a home station
at 60 06.86N and 010 49.82E (without the quotation marks):
"=6006.86N/01049.82E-"
You will probably have a more southern latitude and western longitude.
The position values are ddmm.mm for latitude and dddmm.mm for
longitude. mm.mm is minutes and decimals of minutes.

3407. APRS tracking on a mapping GPS

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-10 19:22:04 UTC
From: n0qbh
Topic: 3407 Message: 3407

A couple of years ago I developed a couple of PIC based packet radio decoders that were designed to plot APRS position reports on a mapping GPS using the WPL input feature.
Recently, I did a rewrite and added support for mic-e compressed data which makes them compatible with the popular TinyTrak encoder and others.
Here's the urls to both projects.

Cool. One of these days I've got to get my Tracker2 code cleaned up for publication. I think I've got every position format covered, except Maidenhead. What language is yours written in?

How's the zero-crossing decoder working for you? I went with an XR2211-based demodulator. More parts, but still pretty inexpensive.

Magellans have a simple expanded waypoint format that'll let you set the symbol, altitude, and comment as well. It's quite a bit more complicated for Garmin protocol, and I still haven't been able to test all of the possible variants of the waypoint format.

I'll be showing off what I've got working so far at Dayton next week, booths 213-214. I'll probably put a web page up for it after that.

I wrote the programs in microchip assembly. It's the only way I could
fit that much in a 1k chip and run at 4 MHz.
>

Pretty good actually. In testing I've done it's quite close to the
MX-614 version. The single chip version I have on my site works too,
but because it uses the PIC on board comparitor, is very sensitive to
any circuit noise. The XR2211 is a good old chip and it's hard to beat
my old MFJ 1270 for pulling packets out of the mud.

> I wrote the programs in microchip assembly. It's the only way I could
> fit that much in a 1k chip and run at 4 MHz.

Ick. =] Writing (and maintaining) a lot of assembly code is never fun, and I have a particular dislike of PIC assembly, and most Harvard architectures in general. I've got 60k of flash to work with in the T2, and I'm writing just about everything in C. Makes it much easier to maintain, but you pay a premium - especially in small projects - for the convenience. The next generation is probably going in an ARM7-based chip with 256k of flash.

> Pretty good actually. In testing I've done it's quite close to the
> MX-614 version. The single chip version I have on my site works too,
> but because it uses the PIC on board comparitor, is very sensitive to

That is pretty good. I'm finding that tweaking the clock recovery code can make at least a few percent difference in the decode rate, but it's hard to know what settings are best for a given environment.

> any circuit noise. The XR2211 is a good old chip and it's hard to beat
> my old MFJ 1270 for pulling packets out of the mud.

Yeah, it's readily available, flexible, and cheap. I'm using a passive filter very similar to the MFJ-1270B and it seems to work quite well. I was afraid that it'd be too sensitive to temperature variations, but I've been able to get good decode performance from room temperature down to more than -100 F. Haven't tried it in an oven yet. And that's with a fixed tuning setting - the surface mount boards don't even have a tuning pot, just a fixed resistor.

I used a Tinytrack 3 from www.byonics.com with my FT-8900. Used
it for two years practically day in and out on my commute with
no complaints. You will need the cable they have with the 6 pin
data connector for the 8900 and you're set. You configure it via
serial interface. I connected my Garmin ETrex to it and it worked great.

3416. Setting Up A Digipeater

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-14 13:59:43 UTC
From: Wayne Mikel
Topic: 3416 Message: 3416

I am setting up a digipeater in the Pauls Valley OK area where there seems to be a dead area and I need to know what you all think I should set my Kantronics KPC3 (not +) settings at for the best result and to not interfere with any other radio traffic. The antenna will be 20 feet up from the peak of the roof and be hooked up to a yeasu ft1802 running medium power (I can hit the tower where the nearest digipeater is with 5 watts and a j-pole on the side of the house.)

I'm open to all constructive suggestions and look forward to your response.

I am also in the process of setting up a digipeater (KPC v9.1) in this area, Childress, TX. We lost our voice repeater early this week in a tornado. So I have an optimum site to work from.

My question (re: the above URL), is about UIFLOOD command setting it up for either a state or ARRL section. Childress is located 15 miles from Oklahoma and passing APRS information over the state line and into a different section is important. We are in the middle of "Tornado Alley". Does the UIFLOOD command impede the flow of information between the states and/or sections? What can be done to ensure the flow in this area if this is so? Any other comments, suggestions?

Jim, NL7C

3422. RE: [APRS] Newbie Questions

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-16 02:03:55 UTC
From: Richard Bauer
Topic: 3419 Message: 3422

ok, thanks. here goes.

at this point i don't want to spend a lot of $ on this. what i have in mind is a minimalist installation in my camper.

1) i already have a vhf radio, GPS receiver (DeLorme Earthmate LT-20) and laptop in the camper. i presume that all i need now is an APRS TNC and software, correct? i have a west mountain radio rigblaster nomic TNC at home. can that be used for APRS? if not, what about a tiny tracker TNC...will that function for APRS? in either case what freeware/shareware software should i be using for APRS? the laptop is WinXP Pro SP2.

2) i use the laptop for GPS navigation and GPS applications (campground finder, ARRL TravelPlus) while we're driving and for other applications when we're parked in a campground. although my GPS receiver connects to the laptop via USB port, i run a serial emulator that allows me to run multiple, simultaneous GPS applications. the emulator allows me to designate a COM port for GPS applications that require a serial connection. since i'd rather not deploy two GPS receivers will my earthmate lt-20 suffice as a GPS receiver for APRS? the lt-20 is a 12-channel NMEA compliant receiver that is also WAAS enabled (other specs here ==> <http://delorme.com/earthmatelt20/specifications.asp>. does anyone have any experience running APRS using the lt-20 and/or APRS software through one of these serial emulators?

3) is the APRS software on the laptop needed to simply configure the TNC once or does the software have to be running in order for location plots to be sent out?

3) i presume that the gps receiver needs to be connected to the laptop in order to broadcast a location, right? while we're in motion the GPS receiver will be connected to the laptop but that's not the case when we're camped. i usually disconnect it from the GPS receiver for other applications such as e-mail, etc. i'd like to leave the radio/tnc on while we're camped in order to broadcast our location but if the GPS receiver is not attached to the system via the laptop i don't see how the radio/tnc can possibly know where we are, right? as an alternative, how long will my last signal report/location plot remain in the system for my family and friends to retrieve?

4) i've heard that there are free websites available where one can retrieve location plots of APRS users. can you point me to one of these websites?

thanks for the help.

Rich,

The best IMHO APRS software is UI-View:
http://www.apritch.myby.co.uk/uiview.htm
Also there is a link for AGWPE a sound card Packet Engine on that page, that would be the easy way to go IMHO.
UI-View has an extensive help file and can help with a lot of your questions. Download extra maps at
http://www.apritch.myby.co.uk/uiview.htm

Both have groups on Yahoo:
AGWPE: http://groups.yahoo.com/group/SV2AGW/
UI-View: http://groups.yahoo.com/group/ui-view/

HTH,

Jerry - K0HZI

> software, correct?

Yes you have a good start. A hardware TNC is nice, but AGWPE can use
your sound card to do the job. APRS should have a dedicated radio, so
if you want to talk on 2M you need two radios.

> i have a west mountain radio rigblaster nomic TNC at home. can that be
> used for APRS?

1200 baud AX.25 protocol? Maybe it will work, if not use AGWPE.

> if not, what about a tiny tracker TNC...will that function for APRS?

Tiny Track is transmit only. It will send your position, but that's
all. You would be missing at least half the fun.

> in either case what freeware/shareware software should i be using for APRS?

UI-View, Precision Maps 7.0, and maybe AGWPE. Precision Maps is not
free/shareware though. It makes a big enough difference in the way maps
work I consider it essential to an UI-View set up in the United States.

> 2) i use the laptop for GPS navigation and GPS applications (campground
> finder, ARRL TravelPlus) while we're driving and for other applications when
> we're parked in a campground.

UI-View, Precision Maps, and the Pmap server program do a good job
showing your position on a moving map. It also shows the position of
all the other APRS users in your area.

> although my GPS receiver connects to the
> laptop via USB port, i run a serial emulator that allows me to run multiple,
> simultaneous GPS applications. the emulator allows me to designate a COM
> port for GPS applications that require a serial connection.

I haven't tried that particular combination, if you can make it appear
that the GPS data comes from a port between com1 and com8, UI-View
should be able to see it. If you use a real TNC it will need its own
serial port. AGWPE will also need a serial or parallel port to put the
radio into transmit mode. This is the worst part of using it, as it
requires some some simple electronics to be built.

> 3) is the APRS software on the laptop needed to simply configure the TNC
> once or does the software have to be running in order for location plots to

> be sent out?

The TinyTrack just needs to be programmed. If you are already using the laptop for mapping while driving, just switch to UI-View instead of your usual mapping program.

> 3) i presume that the gps receiver needs to be connected to the laptop in

One feature of UI-View, it provides two modes of operation based on if it hears a valid GPS data stream. I have one set up to display a House icon, and transmit position and status messages, every 30 minutes. The other transmits every 5 minutes, every 2 miles, or if I make a dramatic change in speed or heading. It displays a truck icon. To switch between them, I just turn the GPS on or off.

> 4) i've heard that there are free websites available where one can retrieve

ok, so my earthmate lt-20 receiver will work for aprs, right? i won't need
a different receiver?

> i have a west mountain radio rigblaster nomic TNC at home. can that be
> used for APRS?

>>> 1200 baud AX.25 protocol? Maybe it will work, if not use AGWPE. >>>

if i recall that is standard packet radio protocol. good, i won't need
another tnc.

> if not, what about a tiny tracker TNC...will that function for APRS?

<<< Tiny Track is transmit only. It will send your position, but that's
all. You would be missing at least half the fun. >>>

well, my goal is to make my position available to my family and friends so
the tiny tracker will meet those requirements...but you're right. i may end
up wanting to do a lot more. since my rigblaster will work then this is a
mute point.

> in either case what freeware/shareware software should i be using for
APRS?

<<< UI-View, Precision Maps 7.0, and maybe AGWPE. Precision Maps is not
free/shareware though. It makes a big enough difference in the way maps
work I consider it essential to an UI-View set up in the United States. >>>

ok on the UI-View. thanks.

> although my GPS receiver connects to the

This is the worst part of using it, as it requires some some simple electronics to be built. >>>

yes, my rigblaster tnc connects between the 706 and the computer via a serial port and that's fine. if the software (UI-View) needs a serial connection for the GPS signal then my serial emulator should work fine.

> 3) is the APRS software on the laptop needed to simply configure the TNC
> once or does the software have to be running in order for location plots
to
> be sent out?

<<< The TinyTrack just needs to be programmed. If you are already using the laptop for mapping while driving, just switch to UI-View instead of your usual mapping program. >>>

does this mean that once the tiny tracker has been programmed it can function without the laptop software running?

> 3) i presume that the gps receiver needs to be connected to the laptop in

them, I just turn the GPS on or off. >>>

my problem is that once we're stopped at a campground the laptop comes off of the dash which means i disconnect it from the gps receiver (and thus the radio and tnc). so what i'm wondering is how long will the last signal report put into the system remain in the system for the folks back home to retrieve? hours? days?

> 4) i've heard that there are free websites available where one can retrieve

3428. APRS Tracker (OpenTracker)

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-16 22:05:42 UTC
From: Ben - ne5B
Topic: 3428 Message: 3428

I'm fairly new to the APRS world. Currently running 2 APRS Digis using Kantronics TNCS http://texasvhf.org/VHF/aprs_ne5b-10.asp and http://texasvhf.org/VHF/aprs_ne5b.asp

I'm looking to get a GPS and tracker device to use with my Icom 2720. Have looked at the TinyTrak but also found another device the "OpenTracker".

Does anyone on this list have experience with the "OPENTRACKER" APRS Tracker Device see http://n1vg.net/opentracker/ for more information.

It's sold on the website - https://www.argentdata.com
Anyone have experice ordering from this company?

73 Ben - ne5B

Rick and Richard,

Rigblasters are not TNCs, they are sound card interfaces. You will
need to use a software TNC emulator such as AGW packet engine if you
decide to go this route.

I'm Scott Miller, N1VG - the OpenTracker is my creation, and Argent Data Systems is my company. I'll be happy to answer any questions you've got. Better yet, if you're going to be at Dayton Hamvention this weekend, stop by booths 213-214 and see me.

I'm going to be closing up the web store later today, since most of the stuff is already packed for Dayton and I'm leaving early tomorrow morning and won't be able to ship any more orders until I get back. I should be back in business on Monday.

Scott

3434. [APRS] APRS Tracker (OpenTracker)

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-17 17:56:10 UTC
From: Heaton, Brad
Topic: 3428 Message: 3434

I have one. I like it better that my TinyTrak3. It works well, it is flash upgradeable and open source. There are a couple of things the TT3 does that the OT doesn't but there are many things the OT does the TT3 doesn't. Scott is very helpful and regularly releases new versions of the code. I highly recommend the OpenTracker; unless of course you can wait for the OpenTracker 2 that should be in production in the next few month. I have been a beta tester for it and I am extremely impressed. In short, it receives as well as transmits, plots positions heard on a GPS map, digipeats, works as a KISS TNC and much more. I can't wait to get more of them.

Subject: [APRS] APRS Tracker (OpenTracker)

I'm fairly new to the APRS world. Currently running 2 APRS Digis using Kantronics TNCS http://texasvhf.org/VHF/aprs_ne5b-10.asp and http://texasvhf.org/VHF/aprs_ne5b.asp

I'm looking to get a GPS and tracker device to use with my Icom 2720. Have looked at the TinyTrak but also found another device the "OpenTracker".

Does anyone on this list have experience with the "OPENTRACKER" APRS Tracker Device see http://n1vg.net/opentracker/ for more information.

It's sold on the website - https://www.argentdata.com
Anyone have experice ordering from this company?

73 Ben - ne5B

Yes it will work with UI-View if you have the Delorme virtual comport driver installed. If it wasn't on the install CD you can download it here:
<http://www.delorme.com/support/supporttemplate.aspx?id=217>

> _____
> _____

>
> if i recall that is standard packet radio protocol. good, i won't need
> another tnc.

The Rigblaster isn't a TNC. It is a soundcard interface, but it
should work with AGWPE or Flex32 and your sound card to perform
the TNC function for UI-View.

> _____
> _____

If that is the Delorme virtual comport/serial emulation driver,
you should be able to run the mapping software and UI-view at
the sametime from the one GPS receiver. Precision Mapping would
work directly with UI-View for a moving map display, but you can
capture Delorme maps and calibrate them by hand for UI-View
static maps.
>
> <<< I haven't tried that particular combination, if you can make it appear

With the Rigblaster, the APRS software and the soundcard TNC
software need to be running. They can be minimized. UI-View will
pop up a message window if you have an incoming message.

>

Your last internet gated position report will remain on Findu.com for days or weeks.
Of course that could be a hundred miles from where you actually
are. Of course if you have internet access, UI-View can send a
position report via the internet servers.

It's a bridge program written by SV2AGW. It allows sound card
interfaces to work.

Works great now that I have it figured out.

3438. RE: [APRS] Opentracker 2

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-17 19:28:53 UTC
From: Heaton, Brad
Topic: 3428 Message: 3438

The OT2 supports many Garmin GPS units. It seems that there are several different dialects of the Garmin protocol that are not really compatible. It works with my eTrex units and I know Scott has tested with several others but I don't know specifically on the GPS III+. You could inquire on the Tracker2 yahoo group and see if anyone there has tested it. If it doesn't, it would be a matter of Scott adding that dialect. He may need a loan of the GPS to dev/test if he doesn't have one available.

It works really well. On mine it uses the call sign as the waypoint name and picks the best fit symbol to match the symbol sent with the APRS packet. You can also load custom symbols but I haven't done that yet. On the Garmin units that support it it will add altitude and comment text to the waypoint comment field so you can see that info on the GPS as well.

For non Garmin GPS units the OT2 will use standard NMEA sentences to insert the waypoint data. Not as good but that is the limits for many GPS units.

Scott has a prototype of the OT2 in surface mount form that will fit in the same case as the TT3 and the OT. You lose some of the additional I/O pins and such but most features/functions are still there. He says they will be ready before too long but many of us are already drooling on our keyboards waiting for them. I hope my keyboard doesn't corrode before I can get my order in. ;)

As a disclaimer, I'm fairly new to APRS myself, and my only hands-on hardware experience is with the OpenTracker, though I read a lot of Yahoo groups related to APRS and have begun using APRSPoint with a TCP/IP connection only. .

My personal experience is that the OpenTracker is a phenomenonal product and that Scott provides UNPARALLELED technical and sales support. I bought one of the preassembled ones, promptly broke it (my fault), and Scott fixed it immediatley! It's currently in my trunk Velcro'd to the underside of the package tray beaconing happily away.

It's very easy to program using a provided Windows client. Scott will tell you that he needs to clean up the user interface there, and I'll admit that there is a lot going on, but it all makes sense if you read the accompanying PDF manual.

It's sold on the website - https://www.argentdata.com
> Anyone have experice ordering from this company?
>

Scott does an awesome job! No need to worry one bit about ordering from Argent Data.

> with several others but I don't know specifically on the GPS
> III+. You

I tested one - according to my notes it uses the D104 waypoint type, which I've got pretty thoroughly tested. It supports 20-character comments, and has a fair number of symbols supported. Some old ones (GPS 48) have only 16 symbols.

The really fun part is dealing with the undocumented stuff in the waypoint formats. Like how each model seems to have its own quirks about which characters it can and can't display. And some will just drop a character that can't be displayed, and some will choke and lose the rest of the comment. It's been a tedious process to identify all of those quirks for each model.

> GPS units.

It supports Magellan protocol, too - at least for those models with serial interfaces. It's a MUCH simpler protocol, and more forgiving than Garmin's, but the symbol set doesn't match well with the APRS symbols. Cars all wind up being amusement park roller coaster cars, for one. All trucks get turned into tow trucks. Garmin's symbols match much better, and with the units that support custom symbols you can get as many real APRS symbols as you can fit in the available slots.

The Magellan protocol doesn't show up as an option in the configuration, because it's an NMEA extension and coexists with NMEA. If you're not in Garmin mode, it sends both standard NMEA (GPWPL) and Magellan (PGMGNWPL) together.

3443. Anti-Tracker

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-17 21:18:51 UTC
From: Deeply Shrouded
Topic: 3443 Message: 3443

I'm still interested in showing APRS positions on a GPS.
Has anyone in the USA built an antitracker or something
that will also work with the tinytrak3?

--Deeply Shrouded & Quiet

From: scott@opentrac.org
Topic: 3443 Message: 3444

The small version of my Tracker2 is the size of the TinyTrak and handles both the transmit and receive sides. I haven't got the website ready yet, and I'm busy getting flyers ready for Dayton at the moment. It's still in beta testing, but it'll be available in the next couple of months.

See my article in the current TAPR PSR, page 13...

http://www.tapr.org/pphlogger/dlcount.php?id=tapr&url=ftp://ftp.tapr.org/psr/Spring_99_2006.pdf

Stop by booths 213-214 at Dayton for a demo. Assuming I get one put together before my plane leaves. =]

From: Richard Bauer
Topic: 3419 Message: 3445

what compact tnc would you recommend? space in the camper is at a premium.

73,
rich, n9dko

Rick and Richard,

Rigblasters are not TNCs, they are sound card interfaces. You will
need to use a software TNC emulator such as AGW packet engine if you
decide to go this route.

Topic: 3419 Message: 3446

mike,

<<< The Rigblaster isn't a TNC. It is a soundcard interface, but it should work with AGWPE or Flex32 and your sound card to perform the TNC function for UI-View.

ok on the rigblaster.

<<< If that is the Delorme virtual comport/serial emulation driver, you should be able to run the mapping software and UI-view at the sametime from the one GPS receiver. Precision Mapping would work directly with UI-View for a moving map display, but you can capture Delorme maps and calibrate them by hand for UI-View static maps. >>>

yes i have the delorme serial emulator installed. i use it to simultaneously run street atlas, trailer life's campground navigator and the arrl travelplus software off the earthmate lt-20. i'm less interested (for now, anyway) in watching a moving map of aprs stations as we drive. my initial goal is just to be able to transmit my position so my friends and family can locate me. i realize that the accuracy of the plot will depend on a station receiving my signal and that may be miles away from where we finally end up. your comment that i can insert a position report via the net is good news as we usually have internet access (worst case via cellphone).

<<< With the Rigblaster, the APRS software and the soundcard TNC software need to be running. They can be minimized. UI-View will pop up a message window if you have an incoming message. >>>

well, on the one hand, using the rigblaster is attractive since i already have it and the cable for the icom 706, it's small and doesn't require any power. on the other hand, the TT3 or the OpenTracker are attractive because they are even smaller than the rigblaster. i don't want a lot of cables running on or over the dashboard and i don't want to spend a whole lot of $ at first until i see what kind of results i get.

73,
rich, n9dko

If you are in to building your own circuits here's a link to three of
my designs that do just what you asked for.
The MX614 modem version
http://www.ringolake.com/pic_proj/decoder/rx_206.html
The ZCD versions
http://www.ringolake.com/pic_proj/zcd/zcdmodem.html

All the GPS versions now support compressed mic-e as well as standard
APRS lat/long formats.

Rich,

If you are going to use it with UI-View the TNC-X is a good one, <http://www.tnc-x.com/>. The other choice is the
Kantronics KPC-3+. Both are quite small. I run them from the +8 volts that is available on the mic jack on many radios.

The easy solution is to use a Kenwood TH-D7 or TM-D700 and a mapping
GPS which will accept NMEA input (like, e.g. any Garmin GPSMAP with a
RS232 cable)

I can't remember if I answered this or not yet - my brain is fried from 3 straight days of standing and talking at Dayton!

It will indeed work with a III+, and I've got some screenshots that I'll put up as soon as I get the website going. Which had better be soon, since I handed out a few hundred flyers that reference it!

3455. Lowrance GlobalNav/12 Interface - Plug / Cable

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-24 02:54:17 UTC
From: Ben - ne5B
Topic: 3455 Message: 3455

I have a Lowrance GlobalNav 12, that I bought back in or around 1998 just before the GPSs with all the maping capabilities arrived on the market.

I'm looking for a cable or the parts to build a data cable for interfacing this old GPS to a tracker.

Lowrance sold a Data Cable for it, however I didn't buy one then and can't find a mention of it now on their website.

At some point a couple of years ago I recall someone that came up with a homebrew plug and had made several of them and was offering them for sale. Anyone on the list recall who that was?

73 Ben - ne5B

3456. analouge values sending data ideas req

Yahoo group: APRS (1998 — 2006)

From: Frank
Topic: 3456 Message: 3456

Greetings,

I wish to use a APRS Tracker with the ability to send up to 3 analouge varibles eg battery voltage, charge current and discharge current

looking a maybe a open tracker using analouge inputs and send as 0-255 data range or as decimal value, or use a pic micro with anlouge inputs eg 16f88 to send beacon text to a mini tnc, i got some ideas but im not that into software to design my own, looking for ideas and if some others done the same.

Regards

Frank VK3ZFS

The OpenTracker will do it as-is. Two of the analog inputs are normally used by the on-board temperature and voltage sensors, but if you want to use them for something else you can just omit the parts when you build it. All three are available on the pin header. Turning on the telemetry packet option will output the 0-255 readings, plus the digital counter value and the jumper status.

I also just did a modified version that has 4 inputs, but doesn't have any ability to tell when the channel is busy.

3458. Deluo Mini connector pinout?

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-23 06:15:52 UTC
From: digi9345
Topic: 3458 Message: 3458

Would anyone happen to know what the pin-out is for Deluo's mini connector? I have one of the 'mouse' antenna/receivers and would like to be able to connect it with the mini connector rather than to go through one of Delou's adaptor cables.

John [K7SVV]

3459. Delou Mini DIN Pin=out?

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-24 06:16:08 UTC
From: John [K7SVV]
Topic: 3459 Message: 3459

I would like to attach my Delou Mouse GPS receiver to my TT3 using Delou's Mini-Din connector instead of using the serial adaptor cable that Delou supplies but I need the pin-out of the Mini Din connector. I found a couple of messages in the archives asking the same question but I wasn't able to find an answer with the pin-out.

I've got it on my site at
https://www.argentdata.com/catalog/product_info.php?products_id=23:

Looking into the end of the connector, with the alignment notch up, starting
from the pin to the left of the notch and continuing counterclockwise, the
pinouts are as follows:

1 (Green) - GPS data out
2 (Blue) - No connection
3 (Red) - Power in
4 (Black) - Ground
5 (White) - GPS data in
6 (Yellow) - 1PPS

For the TinyTrak3+ or OpenTracker DB9, pin 5 is ground, 2 is data in from
the GPS, 3 is data out to the GPS, and 4 is +5 volt power.

3462. WinAPRS - How to?

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-29 16:19:02 UTC
From: Beischel
Topic: 3462 Message: 3462

I trying to set-up WinAPRS, I ran into a couple of issues.

If I want to use one or two ARPS servers only, and want to log into a filtered port, where do I input the filter rules?

How do I specify the APRS servers I want to use?

The help file shows that sounds are associated with events like new message coming in, new station, etc. but my copy does not have a Sounds Folder or any sounds. Anyone know where those .wav files are located?

How do you set a certain map with Tiger maps to be the "home" map so I don't have to constantly set up a new map in Tiger every time the program is restarted.

I also cannot get it to send a message. I have it working with AGWPE which is connected to a Kantronics KPC3+. It will beacon just fine, but when I send a message to a station, nothing happens. It does not go out on RF or the Internet. It shows up in the message listing, but never shows as being ack'd (well I guess it can't if it never goes out).

I Paypaled the money for registration on Saturday. Anyone know how long it takes them to get back with the registration code?

3463. Call Substitution on KAM+

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-30 06:30:05 UTC
From: Tracy
Topic: 3463 Message: 3463

I have a KAM+ with 8.2 level code.

The manual says I can enable call substitution for unproto calls by using the UIDIGI command:

"Here, three digis, with MYCALLs of A, B, and C, are configured with aliases of RELAY ...

"Any one of the stations monitoring will then display the resulting action as follows:

'station B:' cmd: UIDIGI ON RELAY, WIDE, TRACE
'another station:' cmd:W6OTH>GPS,RELAY,WIDE,TRACE:<UI>:5
[will be repeated as:]
'W6OTH>GPS,B*,WIDE,TRACE:<UI>:5'
ETC.

I have tried all combinations of UIDIGI, ALIAS, UIFLOOD, UITRACE, UIDWAIT and UIGATE and cannot get the right magic to replace RELAY,WIDE or ECHO when the TNC relays a packet. Nor can I get call substitution on gating from HF to VHF.

Any suggestions?

Topic: 3462 Message: 3464

Sounds like you have WinAPRS running except for some minor detail. I have connected to PSK front end server defined in the PORTS.INI file and use the Setup, TCP/IP Connections, Connect to connect to a full open server or a filtered server from the server list. Inspect \winaprs*.ini files. I can send my INI files to you if that helps.

My hardware setup is either a Kenwood D7 bare foot or a Kantronics KPC-3 with FT817. I also use a software PSK server as a front end for HF ops. Each is an option and depends on how I start WinAPRS.

Go to \winaprs\ports and here is an actual socal.prt port file

```
\\ My port file for socal.aprs Full Open server
NAME socal.aprs2.net:10151
TYPE TCP
PARSER APRS
HOST socal.aprs2.net:10151
PATH wide2-2
BAND TCP
```

Change/add/delete a prt file per your needs.

Remember the Internet server you choose and the port you choose determines the full filtered or the full opened results. I don't remember where the filtering parameters go in WinAPRS but it seems to me you can select RF or TCP filtering or draw a circle around the area of interest. SCS APRS has filtering.

Make sure you have the latest version of WinAPRS 2.8.4. I have had very good results when the very latest TIGER maps are downloaded from the tiger site.

There is a site that explains each APRS Internet Server, location, IP addresses and function of each port but that info is not on this PC. Maybe someone else has that reference because it is full of excellent information for the advanced APRS user.

Restart WinAPRS and the new PORT file will appear. Don't forget that you have to initiate and START the port for it to function.

Good luck, Bill k6acj

Serial Ports: Setup, COM Port
PSK Servers: Setup,
IP Ports

Here is the link to the APRS-IS Servers that detail available data that would eventually go into your \winaprs\ports\prt file, one per server, ditto for AGWPE and TNC/Serial ports. This is where WinAPRS shines, lots of options although being Industrial strength, a little hard for the newcomer to understand.

Re the startup map, check the content of each configuration file in \winaprs and modify. Save a backup first.

Bill,

Let me get a bit more specific so maybe you can tell me if it can be accomplished. I want to log into midwest.aprs2.net port 14580 and tell it upon log-in that I want "filter r/39/-084/200". From what I have read there seems to be no way to do it. Right now I log in, and then send the filter spec via an APRS message to "SERVER". Not the preferred way of doing it. Is there a way to have it send the filter string to the server upon log-in?

Also, I can't figure out another issue. I cannot send a message via RF! I can send it via TCP, but when I tell it to go via RF, it acts like it is sending it, but nothing happens. Very puzzling.

3467. TM-D700 "Group Code" question

Yahoo group: APRS (1998 — 2006)
Date: 2006-05-31 16:03:24 UTC
From: Wayne T. Miles
Topic: 3467 Message: 3467

Greetings,

I have a Kenwood D700 and would like to "filter out" weather stations sometimes...

Is there a way to do this using group codes? I was wondering if all weather stations are set up some way that would allow users to set up a filter.

I know that I can set the 6 digit code to receive things like CQ, BEACON, and SPCL transmissions, but is it possible to filter some out?

Maybe even select to receive all "FIXED" or "MOBILE" stations only?

If anyone can help or has a web page that they can point me to, I would be very pleased.

Thanks!

Wayne Miles, KG4TCJ

Until I lost my WiFi connection, I had a large and detailed response for you. Here goes a summary:
First it sounds like you are setting up the servers is aprsservers.txt and you are using the port files to define you PSK/PACKET/AGWPE and Serial ports.

> Let me get a bit more specific so maybe you can tell me if it can be
> accomplished. I want to log into midwest.aprs2.net port 14580 and
> tell it upon log-in that I want "filter r/39/-084/200".

Yes, 14580 is the filtered port while 10151 and 10154 are full open depending on APRS-IS server.

Since 'filtered' is not found in the HELP files, do this,

Connect to a full open APRS-IS server and right click and drag the mouse across the geographic area on the map of interest. The Display will zoom in to that area and only stations in that area will display but of course the open IS servers will continue to send all stations heard unless you are 'tracking' moving stations.

I have not connected to a TNC and the internet at the same time but I think your message will go out the port that heard the station in question. If heard only on RF, then the message goes out RF, if heard only on TCP, then the message goes out TCP. Its part of the routing function in APRS.

You could take a look at another APRS program called SCS-APRS where the server and filters are right up front on the setup page. Also, groups can be added. I've SCS on HF with a PSK63 front end server and although I have used WinAPRS on HF (TNC or AGWPE or TCP), the RETRY count cannot be set to less than 2 which causes HF message management problems but it is fine on VHF.

I'll see what I can do with the filtering and have never tried you routine. I'm curious if your filter could be added to the tail of the server definition in aprsserers.txt for auto transmission at open time. Anyway, you might find that unnecessary if you use the right click procedure.

As far as a startup map, Check out config.txt as it might contain more commands than described in HELP. I'm running WinAPRS 2.8.4, the latest.

Bill K6ACJ

3471. New update: Adaptive Home Logic v1.01

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-02 09:45:14 UTC
From: acentient_software
Topic: 3471 Message: 3471

Adaptive Home Logic allows you to monitor & control your home automation peripherals via APRS short text messages.

This is a significant update that integrates the power & integrity of SQL (zero-configuration), and support for Windows Script Host for advanced users that wish to plug-in their own VBScript (Visual Basic Script) or JScript (Java Script) routines into the program to provide additional or specialist functionality, complex `if-then-else' scenarios, etc.

Support is also provided for RS-485 (multi-drop serial network) and X10 via the CM11 or Firecracker Power Line Interfaces.

New low price, only US$ 29.95

Please see our new updated website for details.

http://www.acentient-software.com

3472. WX Reports via WinLink 2000?

Bill,

Are you running UI-View for APRS? If you registered the program, the registration conformation email should contain "Your input number for the validation. The validation number for W5WHT is ....."
The Validation number is NOT the same as the software registration number.

With a laptop because of no or limited com ports you run AGWPE soundcard Packet Engine, that interfaces with UI-View nicely.
AGWPE: http://www.elcom.gr/sv2agw/agwpe.htm

Both of the above programs also have Yahoo groups for support.

HTH,

Jerry - K0HZI

UI View Registration and downloads:
http://www.apritch.myby.co.uk/uiv32_uiview32.php

number in the UI-View APRS Server Setup dialogue.

3476. Garmin GPS 18 PC,KPC3,Kenwood TH215A

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-06 01:33:40 UTC
From: gervais
Topic: 3476 Message: 3476

hi all,

well i have these equipment to use as a mobile APRS station,

An Garmin GPS 18 PC magnetic gps with an DB9 data jack,a KPC3 tnc and a portable TH 215A from kenwood ,i dont know how to connect it between them so my station would work?

Is there someone that could send me a diagramm of how to interconnect them?

maybe via the 12vdc of the cigarette lighter adapter of the GPS i could supply the kpc3 in dc???

thanks for your help,

ve2ckn@... <mailto:ve2ckn@...>

gervais ,ve2ckn

Hello Kim,

I have been very satisfied with the WXTrak TNC available from Byonics (http://www.byonics.com/wxtrak) coupled with one of the latest models of the Peet Weather Stations (peetbros@...).

Expect to pay a significant price for the weather station. The TNC is very reasonably priced.

See my station on "findu" as W3NRG-1.

73,

Ed

If you're just after wind and temperature, an AAG TAI8515 1-wire weather instrument will do it for about $75, coupled with one of my OpenTrackers ($29) with the weather firmware loaded.

See N1VG-2 for an example. The OpenTracker will also support Peet Bros stations.

I've had the same basic question, but just hadn't asked it yet, the only differince I'd add the word Economical to it.

What Economical Makes/Models of Wx stations are out there that can be hooked up to either an Opentracker or perhaps to a KPC3+ TNC?

What's out there under $150 or $100 that is accurate and has at least Temperature, wind speed/direction that can be upgraded by adding Humidity, Barometer and Rain gauge to at a later time????

I've browsed through Website after website and they all run together after a while!

This new Yahoo format really sucks! Can no longer delete the extra stuff that you don't want to send back to the group.

As far as weather stations, if you want something that works well and is accurate, you need to stick with Peet, Davis or Oregon Scientific. As soon as you want wind speed/direction, you are taking it out of the inexpensive category.

3483. RE: [APRS] Weather Stations

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-06 17:31:57 UTC
From: scott@opentrac.org
Topic: 3476 Message: 3483

And the new format is driving spam filters crazy everywhere. I had to fish a ton of stuff out of my own filter this morning, and every time I post I get spam filter bounce messages.

The 1-wire stations do wind speed and direction inexpensively, but that's about all they do. They have temperature sensors, but there's no ventilation in there so if the unit is in direct sunlight it's not going to be reliable. They also probably don't hold up as well to harsh winters. Out here in California they work just great for things like paraglider flight areas, where all you need is wind data.

You can add humidity sensors (the only add-on the OpenTracker supports for now) and a few others, but at some point it's cheaper just to get a Peet or Davis.

Scott

If you are having problems from Yahoo's latest change to Group Messages.
Do the following and wait 24 hours for messages to go back the way they used to be.
Go to Yahoogroups.com
Click on each group you are a member of in Yahoo.
Then, "Edit Membership" and set "Message Preference"
to "Traditional", the old message format will be restored after 24 hours.

so Wind Speed / Direction is the item that Drives the $ up.

What sensors are the most expensive? Can some one send a list in order by cost.

To rephrase my question:
What's a good economical yet accurate make and model that interfaces to Trackers / TNCs that we can add the more expensive stuff to later????
What comes on these ?
Are you using one of these?
If on the web what's the URL FINDU.com or other to the weather data from it.

Thanks and 73
Ben - ne5B

PS: I'm subscribed with plain text which is the only reliable way I can view and reply using the webbased Email provided by my host. So far I haven't had any thing come back because Yahoo added extra code that triggered any spam filters....

Can't you? New format? I read something about it on the Yahoo! web page, but the email from yahoo lists is looking just the same to me, I can mark what I want quoted, and remove what I marked but shouldn't have marked, also copy from the previous message and paste as quote into my follow-up.

It might be a question of which software you are using to receive and send email with.

Depends on how you have your e-mail software set up. I use Microsoft Outlook, and have it set to receive all e-mail in the format in which it is sent. I can always change it to text only, but I would miss a lot of things sent to me. Sounds like you have yours set for text only.

Dick

I tried one of my yahoo groups. "Traditional" was marked, so it seemed
that the "new" format had to be actively chosen by the user. (my
groups at Yahoo UK didn't have the "new feature".)

Since my email and news reader software does not display html
formatted messages, I am very happy with things as they were. No need
for the additional formatting byte overload compared to plain text
messages. The APRS messages are plain text as well :-)

Hi, Dick;
As you mightn't have seen in my email headers, I do not use Outlook
(nor Outlook Express), but Fort? Agent. Luckily enough, there is no
option to set for the format. Also, I have selected No HTML for my
groups when I subscribed to them.

I got 4 such bounces some minutes ago (and will probably become more).
All from one domain: postmaster@..., and with chinese
callsigns in the recipient addresses. So that might me another issue
than the yahoo format; rather a measure to protect chinese hams from
messages from certain countries or domains, just like verizon's and
aol's way of protecting its customers from e-mail from e.g. Norway
(only, _they_ accept email via email lists like yahoo).

All nine of the messages that bounced back to me this morning were from that domain. It is strange that it bounces back to me, and not Yahoo. My messages are getting through to the group. But then I get these strange bounces in a format that is barely readable. Must be Chinese being translated back to English.

Anyway, it's good to _know_ we're under surveillance :-)
Probably the list owner should set the message status to No email for
those in question, and ask the recipient in a plain text message to
chande their setup to plain text only. The "error" message(s) said
that more than 90% of each of my messages were html formatted - and I
never send anything html formatted, so that must be a format change
made by yahoo.

>My messages are getting through to the group.

So do mine, as we can see :-)
(and now we get yet another chinese bounce; only, I have put that
domain in the mailwasher trash bin)

Oh, still under Weather Stations thread. Oh, well. We shouldn't bother
discussing this; rather ask the owner to do some investigations. I
will see what I can do in the ui-view group.

>This new Yahoo format really sucks! Can no longer delete the extra stuff
>that you don't want to send back to the group.

Can't you? New format? I read something about it on the Yahoo! web
page, but the email from yahoo lists is looking just the same to me, I
can mark what I want quoted, and remove what I marked but shouldn't
have marked, also copy from the previous message and paste as quote
into my follow-up.

It might be a question of which software you are using to receive and
send email with.

From: acentient_software
Topic: 3471 Message: 3498

Hi Jim,

Thank you for your interest.

When connected to a TNC in packet mode, The Adaptive Home Logic application has the ability to interpret monitored APRS radio traffic, responding to a correctly formatted APRS short text message addressed to it from an authorised station. It will then acknowledgement the message and carry out the instruction. It can then also reply with the results of the action, either directly or via digipeaters. The program can also send an APRS message if the status of an event changes. Security is provided by a (plain text) static or user-definable time related PIN code.

Have you downloaded the free evaluation? There is a detailed description of how the program operates with APRS; instruction for linking to a TNC, plus the history of how the idea came about, within the application's (easy going) help file.

"Enter the future; use your Windows XP system to computerise & automate your home. With this new, easy-to-use application you can very easily control your lights, appliances & HVAC automatically, by speech or remotely. Featuring Two-Way Speech, X10, RS-232 / RS-485, Digital I/O, Remote Access (APRS / Internet), Screen Overlay Scenes, Sun Rise/Set times, + more!"

3501. KENWOOD D7 APRS - strange !

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-09 02:16:44 UTC
From: k8srb
Topic: 3501 Message: 3501

Here is a strange problem:
Setup 1. kamplus v8.2 running uiv32 with FT7800 or IC208 works great. All stations transmitting beacons show up on uiv32. I-gate and digi works great too.
Setup 2. kenwood D700 mobile APRS mode working great. Beacons from the D7 show up on the D700 every time.
Setup 3. kenwood D7 portable APRS mode only receives great, and transmitting good to the Setup 2 (d700) only. I can see beacon go out on the D7, but do not see the beacon on Setup 1, unless I move D7 freq from 144.39 to 144.40. Then I can see all packets on the uiv32 (setup 1). In both cases I can see and hear the beacons on the rf radios ok.

One additional test, I replaced the Setup 1. radio with Yaesu FT1500. With this radio, all stations are showing up on my uiv32, but I can not get beacons from D7 to display. I can see and hear the on FT1500, but nothing in the terminal window. Even changing the D7 TX freq to 144.40 does not do anything.

I am open for ideas.
Thanks, Stan K8SRB

Catchy title huh?

I'm building a APRS happy meal in a 30 cal ammo can. I'm using a Kenwood TH-225 for the TXCVR, Tinytrack III for the tracker, and a Garmin 18 PC for the GPS. I'm new to the whole portable power thing and I'm looking for suggestions for a 12 volt battery small enough to fit in this enclosure. It's about 4" wide & 6 inches tall. I'd like something that can last about 8 hours with the radio @ 5 watts @ 1 min. intervals. I may can get a 50 cal ammo can if this enclosure is too small. Any ideas?

Thanks,

Jason

From: Paul Lee
Topic: 3504 Message: 3504

This is for those of you running IGATE stations.

The website http://personal.riverusers.com/~aprswest/javAPRS/Igates.html shows active IGATEs map. But I have tracked down a lot of IGATEs that are not showing there because they do not use the conventional Diamond 'I' overlay symbol. If you are running an IGATE please use the correct symbol. Its nice to know where APRS is available.

If you don't know how to set up the symbol here is a view of my ui-view main setup pages http://www.abri.com/sq2000/ui-view-IGATE.jpg - see the station setup.

Well, just goes to show I don't know what I'm doing. I'm not running ui-view
but I'm running WinAPRS (registered) and I'm not showing up there.

What symbol creates the Diamond T? And why isn't it mentioned in the
WinAPRS notes???

So, what is your solution for those of us who are some sort of digi
(RELAY for us in region 1; Wide1-1, WideN-n, whatever) _and_ an Igate
at the same time? My and many others' IGATE function(s) is/are marked
with a blue square outline around the other symbol; how should it have
been done?

And, APRS is available wherever there is another APRS station

OK,
Your most practical battery is the gell-cell brick.
Capacity is measured in amp-hours, i.e it can
deliver X amps for Y hours, however you can only
use about 70% of the capacity... if you suck it too
low you can damage it.

First you need to measure the current drain of the transmitter.
We'll say that it is X amps.
The kenwood web site has no concept of a TH-225 but the H
says it's a handheld, so for this discussion I'm going to use a
nice number and say it's 2 amps.
Yes, yours is less, but it's a nice round number that
nicely plugs into the formula and it's better to have a
too-large battery than too-small.

Then you need to measure how long the transmitter is on
when the location is sent. Let's say it is Y seconds.
For this discussion I'm going to say it's 2 seconds, or
1/30 if a minute, or 1/1800 of an hour.
Again, yours is probably less, but it's better to have a
too-large battery than too-small.

You say that you are going to beacon once per minute.
That's wayyyyy too often (read up on "Smart Beaconing",
but still, let's use your numbers.
There are 60*8 minutes in 8 hours, so that is 480 transmissions
of Y seconds long, which is 950 seconds of air time.

So using the numbers above, 480 x 1/1800 x 2 = about 0.53
So a 1/2 hour gell-cell would run barely just your radio, but with
zero headroom for the GPS, or the TT3, or the 30% reserve.

And how about voltages? Is the handheld, GPS and TT3 all
the same voltage?
I know that the GPS18 has a 12v to 5v voltage regulator in the
plug, and the TT3 runs on 12v. But does the handheld?
I doubt it. That means another voltage dropping regulator, and
that's more wasted energy.

So let's figure that the GPS will be running 50ma at 12v.
The TT3 draws under 10ma plus whatever the LEDs draw, so
we can ignore it.

Small gell-cells typically come in these sizes, or close to it:
1.2Ah, 2.3Ah, 4Ah, 5ah, 7Ah, 10ah, 12ah. Not every manufacturer
makes every size.
As you can see, the smallest will more than handle your application.
A D-size cell is about 2ah, and on a cost-per-ampere-hour basis you
are paying a premium on them due to the specialized size.
However I'd take your ammo can and pick whatever size fits snugly into
the bottom, then get two and put one in each end, and wire in parallel.
This gives you a physically balanced load, and extra power.

My first ammo can was a 30-cal and was too small for what I
wanted to carry. It had one battery and a 10w 220MHz mobile.
It was end-heavy and difficult to carry. I added a second battery
in the other end and while it was heavier it was easier to carry,
but was a tight fit. I switched to a 50-cal for more room and put
two gell-cells in the ends and cut a piece of a 1x4 and wedged
it between them. The two batteries I used are 7ah units left over
from computer UPS units and while two of them are a little heavy,
I now use an Icom 2100 mobile radio in it. The ammo can does
triple duty as a tracker, as a portable base station for special
events and can be the 2m side of a portable UHF remote base.

As a portable base (for example, a special event like a city parade)
it will run for several hours before I need to worry about a charger.
The Icom does 5w, 10w, or 55w and in city parade base station use
I can run it at 5w mode since I use a small portable beam.

Use a monospaced font between the === markers to see
how I mounted the batteries in the ammo box: (the batteries
lay flat on their side)

```
===
Ammo can --
!
V
+-----------------------------------------+
! +------+ +------+ !
! ! ! ! ! !
```

```
! ! batt !=========================! batt ! !
! ! ! ^ ! ! !
! +------+ ! +------+ !
+-------------------- ! -------------------+
!
!
```
Wood brace cut to length and an eight of
an inch too long and wedged in place
===

When I do it over, I am going to make up a U-shaped
subchassis and mount the batteries, radio, TT3, etc. Then
when I need to I can lift the subchassis out and work on it.

Now how to charge the batteries?
You need more than 12v to charge a "12v" gell cell, because
they typically run at around 13v, plus you need extra voltage
to push the charging current through the battery under charge.

I've used a circuit like this one:
<http://www.aaroncake.net/circuits/charger1.htm>
Or this one:
<http://www.edn.com/archives/1996/091296/19di3.htm>
But if this guy was still making boards, I'd use it:
<http://www.geocities.com/vk3em/sla-charger/sla-charger.html>

Build your box right and you can fit the charger inside it.
Scavenge the AC input connector from an old PC power
supply and you can plug in a common cord for charging.

Be very careful that you do not overcharge the gell-cell bricks.
They have a maximum charging level that is usually
around 1/10 of the AH rating - for a 7ah cell that's 700ma.
Personally I charge at 1/20 rate simply because I do not
want to over-temp the cells. Slower overnight charging is
just fine for me.

Battery acquisition:
Locally the cheapest place for gell-cells is the burglar alarm / video
surveillance / low-voltage wiring supply outfit called ADI which has
stores all over the country, including one 5 miles east of me. Web
site at <http://www.adilink.com>.
There's a branch locator at the top right of the page. Their stock
turns over fast enough that you aren't going to be buying a battery
that has been sitting on their shelf for 2 years.

ADI's web site has a nonexistent search function, but you can
click on "product catalogs" at the bottom of the left column and
batteries are on page 58 of the "Intrusion" catalog.

In closing, I think you are going to be dis-satisfied with your
handheld-based trackers performance. Why? It's underpowered.

I'd be willing to bet that within a year your ammo can has a
10w, 20watt or greater mobile in it. You might as well start with
a 50 caliber ammo can now and leave room for it.

Here's an excellent writeup from Steven WA8LMF on using
handhelds or low-powered mobiles as trackers:

>Signal levels that you may consider adequate on voice WON'T
>BE on packet, because data transmission is an all-or-nothing
>proposition.
>--ALL-- that's 100.0% -- of a packet has to be received PERFECTLY
>to recover --ANY-- data from it. The kind of noisy, scratchy,
>not-completely-hard-quieted, operation so many people inflict on
>voice repeaters, especially with underpowered handhelds, JUST
>WONT WORK on data transmissions. A single pop, a momentary
>burst of white noise, one bit of flutter, or multipath-induced phase
>distortion that you don't even notice on voice WILL be fatal to a
>packet transmission.
>
>With APRS, the problem is even worse than with conventional [connected]
>packet because it operates in a non-connected mode. With traditional
>packet, a station receiving a defective packet will automatically send a
>request for retransmission to the sending station (or the sending
>station will automatically retry if the receiving station doesn't
>acknowledge in a reasonable time). With APRS there is no ACK/NAK
>(Negative AcKnowledgement) handshaking process. The sending station
>just blasts out packets at intervals and "hopes" the receiving
>station(s) get them. The receiving station just ignores the packet if
>it is defective in anyway. [This is the price you pay for the

I think the closest I've got here for comparison is 7.62mm NATO, which might be a bit taller. I've got a weather station in a .50 cal that fits two 7.5 amp hour 12 volt gel cells with room for a radio and tracker board.

You need to figure out how much power you're drawing at idle. Usually transmit power consumption is a small fraction of that because of the low duty cycle. A GPS 18 and TT3 will probably draw about 80 mA. My Alinco DJ-F1 draws about 60 mA in receive mode. That's 140 mA total, and maybe another 20 mA average for transmit. Call it 200 mA to be pessimistic, and that gives you 1.6 amp hours for 8 hours of runtime. You should be able to fit a 2 AH 12 volt SLA battery in the .30 cal can with no problem.

A pack of AA batteries will give you about 2 AH, and should be lighter than the equivalent SLA battery. I'd probably just go with a 7.5 AH battery if weight isn't a concern.

The TT3 will also support power control for the radio, to turn off power when it's not needed. In the above example, that'd reduce the power consumption by 60 mA.

My OpenTracker 1m board (still in beta testing, next batch should be ready in about 2 weeks) is designed for exactly that sort of thing. It's got space for an optional 9 or 20 amp high-side switch on the board, and holes big enough to solder 12 gauge wire for power from the battery and to the radio.

If the radio runs on 6 volts, you could use a low dropout regulator for the tracker and GPS (which both need 5 volts) and lose less power to inefficient voltage regulation.

3511. Satellite objects

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-11 20:09:44 UTC
From: Rick Widmer
Topic: 3511 Message: 3511

I am running UI-View connected to an Internet server. My filter is "filter r/42.3/-114.7/150 s//S" The s//S part is to allow satellite positions worldwide. I am seeing a number of satellite objects but I don't understand how to interpret the information.

For example, I now see SO50 3105, IK1SLD, AO27 3105, ISS 0706, ISS 1006, JJ1WTK-3. The ISS positions look like they may be old, as they show points the ISS passed over earlier in the current orbit. (As shown by the Heavens Above site - www.heavens-above.com)

Can someone tell me where these come from, and how to use them. A link to a web site with further information would be great.

Thanks,

Rick

You should really be able to keep the transmission under 1 second - probably about 1/2 second, with a reasonable TXD setting.

> And how about voltages? Is the handheld, GPS and TT3 all
> the same voltage?
> I know that the GPS18 has a 12v to 5v voltage regulator in the

The GPS18PC has a regulator in the plug. The GPS18LVC is straight 5 volts. You don't want to confuse the two! The TT3+ (and all current OpenTrackers) has a large enough regulator to power both the tracker and GPS.

> A D-size cell is about 2ah, and on a cost-per-ampere-hour basis you

Only the cheap rechargeables. AA NiMH cells are about 2 AH these days. A *real* D cell should be at least 7, I think. I had a bookmark for a good source, but I'm not sure where it went. At Wal-Mart you're likely to get a C repackaged as a D, with no more capacity than a AA.

Jan,

Not sure if I have the precise answer - I only run an IGATE.

But I noticed that other symbols show up on the map too - like diamond and 'D' symbols. Presumably that will mean an IGATE and a Digipeater. Also I see diamond and 'S' presumably means an APRS server as well as IGATE. Don't know what diamond with 'N' or 'C' stand for. But they all show up.

I assume you are you running a digipeater to different frequencies and not just APRS. Otherwise what is the purpose of the digi?

I agree, but I wanted to use a non-1 number so that the math would
be obvious. I hope that he actually measures the current draw and
the transmit time, and does his own math.

And after I sent the email I kicked myself for forgetting the receive
current draw, which since it is on continuously, will probably exceed
the total energy usage of the transmitter.

Ah, good point. I still need to pick up a good integrating watt meter one of these days. I should have grabbed one at Dayton, but I managed to get out of my booth for about 20 minutes over the whole weekend, and forgot to bring any cash with me when I did!

> And after I sent the email I kicked myself for forgetting the receive

Most likely. That's why the transmit switch option is there. Once I get the new OT1m boards in I'll do a writeup on those. I've had one run a 60-watt mobile transmitting for a minute or two solid without too much temperature rise in the on-board switch. It's really convenient for things like solar powered weather stations - I ran an early prototype with a 7 AH battery, and a 5-watt solar panel was enough to keep it fully charged. From the telemetry, you could actually see the battery reach full charge just slightly later every day as the length of the day changed.

> >C repackaged as a D, with no more capacity than a AA.
>
> You've run into that too, huh?

Hard not to! I searched all over Fry's looking for a real D and didn't find one. It was really frustrating to see them listed with the exact same capacity as the AA cells of the same brand.

I understand that one !
Been to too many hamfests as a seller and never got out of the booth.

In my ammo box I have a center off toggle switch. Center is off, up is
on, down is reserved for when I get the TT3 to control the power.
What device do you use for the power control?
The Icom 2100 is rated at 12a for full power out (55w) but I've never
seen a radio do 55w out with 60w in...

Maybe it's time to give your PowerSonic or Yuasa rep a call...
The consumer grade stuff won't cut it, maybe the commercial stuff can.
If so, the rep will know who the distributors are.

RELAY? What part of the country still uses that? While we are checking settings for correct symbol we might want to be checking correct UNPROTO paths. Link below shows correct settings.

http://eng.usna.navy.mil/~bruninga/aprs/fix14439.html

If you don't want to read the above I can shorten it up to this; All forms of RELAY,WIDE and TRACE have been discontinued. Homes (not used as a wide coverage area digi) should use WIDE1-1. Mobiles should use WIDE1-1,WIDE2-2 or WIDE1-1,WIDE2-1 (looks strange but yest I typed it correctly). Digi's that cover a wide area should use either WIDE2-2 or WIDE3-3. Usage of anything higher than WIDE3-3 has been _highly_ discouraged. Those would be settings like WIDE4-4,WIDE5-5,WIDE6-6, and WIDE7-7. The reason settings like WIDE7-7 have been discontinued is because of the extreme area you can cover with those settings.

Currently I have a station in Texas that's coming into Central Nebraska WIDE7-3 that started off as a WIDE7-7. Just think if I Digi'd it that packet could wind up as far north as North Dakota. On the eastern side that packet could wind up in Florida and on the western edge that packet could wind up in California. So you thought APRS was a local RF hobbie. :-)

I was using the IPS5451 from IRF, which is now discontinued and being replaced with the IPS6021, I think. In the meantime, I've been using the VN820 (9 amps) or VN920 (20 amps) from ST. The ST parts have a staggered pin layout (Pentawatt 5-pin TO-220) that takes a little bending to make work with the board, but they do work. The traces on the board are 100 mils wide, run on both sides of the board, and are only about 1/3" long. I get my production quantity boards in 2 oz copper, so it should handle a lot of current. I think the IPS6021 is rated at 45 amps, and I think the board will handle it just fine, but I wouldn't suggest a high duty cycle without a heatsink!

> Maybe it's time to give your PowerSonic or Yuasa rep a call...
> The consumer grade stuff won't cut it, maybe the commercial stuff can.
> If so, the rep will know who the distributors are.

I think it must be on my work computer, but I know I've got a site bookmarked that carries 'real' NiMH D-cells. Now, I *could* use some Li-SO2 D-cells (e.g., Saft LO 26 SXC, 9.2 AH @ 3V, 85 grams) but they get kind of expensive.

> I assume you are you running a digipeater to different frequencies and
> not just APRS. Otherwise what is the purpose of the digi?

You comment about different frequencies confuses me. Since 99% of all APRS Digi's digipeat on the same frequency - 144.39. That's how you can travel from area to area without having to change settings. The purpose of the Digi transmitting on the same frequency is so that it can pass the packet onto other stations which are also listening on the common frequency. When a Digi see's a packet it has to make some decisions on if it should Digi that packet or not. If the packet meets all the requirements then the Digi decides to retransmit that packet on the same frequency that it heard it on. To do this it must first listen to make sure it doesn't hear anybody transmitting and then it sends that packet out on the same frequency it heard it on.

This is the reason that correct UNPROTO paths are so important. Since almost all packets get Digi'd at least once you have to cut a 1200 baud frequency in half. Half the time listening and half the time transmitting. Once you realize that your dealing with only 600 baud of available bandwidth you can see how fast you could plug that up. The older dialup modems ran at 56K and those of us that now have high speed internet remember those slow days really well. Now picture the fact that 56K (56000) is a LOT faster than 600 baud and you really start to see the issue of plugging up an RF channel could be a problem.

Hope that's not too much information but you really confused me with the statement about Digi's needing to transmit on different frequencies.

Hi all,

Just got hold of an older pocket PC and have been using it with APRS/CE which I downloaded from the TAPR website. It works well enough to keep it going but the author no longer supports the program and unless it is registered I can not keep the station info or use the server (via bluetooth to my pc). I cant get hold of the author - no email address - Anyone out htere got any ideas? maybe there is a better program? It would have to run on pocket pc 2002.
Look forward to any replies.
Cheers

Stuart ZS6OUN sbaynes@...

You probably ought to cycle it and charge it once in a while just to
keep the plates from sulfating.

OK. I only run a IGATE. The basic purpose of APRS (auto position reporting system - and weather) is passing data from tracking or weather stations to internet (findu.com, etc.) the shortest way possible. For that I don't see a need for a IGATE and a digi at same location. Why digi anything - just pass it on to internet from you IGATE? That is why I wondered if you used your digi for other purposes or frequencies - like pass messages to other radios through internet - but that is not APRS by definition. Am I missing something?

That's why my comment was "What part of the country still uses that?". I suppose I should have expanded my thinking to include "What part of the word..." It's also the reason I asked the question instead of stating a fact. I know there are areas (USA) that haven't converted yet for one valid reason or another.

No it's a subject of much heated discussion on the APRS SIG email list. The basic reason to Digi it is for those that don't have _any_ internet connections at all. Those stations would like to be able to see every thing that people with full time or dial up internet connections can see. The heated part is how much do you Digi on RF verses what you let the internet pass on.

Well, not originally. APRS was designed as a tactical, local RF network with positional awareness as a major component, along with message passing. The Internet part came later.

> ...like pass messages to other radios through internet -
> but that is not APRS by definition.

Not YOUR definition, maybe. Others may feel differently. Neither of you are wrong.

An Ademco or Moose alarm panel (just 2 examples) has a great charging circuit for a single or pair of 7AH SLA batteries. Make sure you opt for a 40VA transformer and not the 25VA that usually comes with the cheap 2 doors and a motion sensor systems. It will charge and keep the cells at the ready.

Someone mentioned ADI. That is a division of Ademco. If they will sell to you that is a great place to get stuff. They generally only deal with licenced alarm installers but laws vary.

I was introduced to ADI by a fellow ham that does phone systems
and video surveillance (among other things) for a living.

I walk into the Irwindale (southern California) store and pay cash all
the time for low voltage wiring stuff (like 1,000 boxes of 3-pair telephone
wire, or boxes of plenum CAT-5, for RJ-45 patch panels, etc.
Also for EKS / telephone systems, video surveillance stuff or gell-cells.

They only ask for an Alarm Installers card (which I do not have) if
you want to buy alarm panels.

Different states have different rules, your mileage may vary.

Subject: [APRS] APRS/CE help please

Hi all,

Just got hold of an older pocket PC and have been using it with APRS/CE which I downloaded from the TAPR website. It works well enough to keep it going but the author no longer supports the program and unless it is registered I can not keep the station info or use the server (via bluetooth to my pc). I cant get hold of the author - no email address - Anyone out htere got any ideas? maybe there is a better program? It would have to run on pocket pc 2002.
Look forward to any replies.
Cheers

OK.
>
>I assume you are you running a digipeater to different frequencies and
>not just APRS. Otherwise what is the purpose of the digi?

I am running one single station at 144.800 MHz, which is the APRS frequency, with fill-in digipeater function, digipeating on my callsign, on RELAY, and on WIDE1-1. This station is also an IGATE routing anything to Internet, and gating some few stations' packets (after request or for special purposes) to RF.

As I am living on an IOTA island, I used to use a IOTA symbol, but changed to a star with an R (for RELAY - yes, we are some thousand kilometers away from the USA) recently to make it more clear that the station in fact will help mobile users to reach a regional digi. The IGATE function is clearly visible for any user (at least UI-View users) by the fact that the station is shown with a blue square outline.

The basic purpose is (as far as I have understood it, from WB4APR and
from experience) to report positions via RF and to send short messages
to stations. This will be helpful for Search and Rescue operations,
and those operations will often be run without any need to be
connected to the Internet; participating stations will typically be in
the field and coordinated by a field station.

To: APRS@yahoogroups.com
Subject: [APRS] Satellite objects
Date: Sun, 11 Jun 2006 13:09:44 -0700

I am running UI-View connected to an Internet server. My filter is "filter r/42.3/-114.7/150 s//S" The s//S part is to allow satellite positions worldwide. I am seeing a number of satellite objects but I don't understand how to interpret the information.

For example, I now see SO50 3105, IK1SLD, AO27 3105, ISS 0706, ISS 1006, JJ1WTK-3. The ISS positions look like they may be old, as they show points the ISS passed over earlier in the current orbit. (As shown by the Heavens Above site - www.heavens-above.com)

Can someone tell me where these come from, and how to use them. A link to a web site with further information would be great.

Thanks,

Rick

My portable APRS consisted of a red metal toolbox with: a Radio Shack 212, a Yuasa 12v 7.2ah sealed battery (for house alarms)and a Paccomm Tiny2 w/ GPS antenna. I had an ICP 135mA solar cell on a long hinge on the back of the toolbox and a 19" 2M antenna on top with an NMO antenna connector. In case the solar cell needed help,I had a mini plug on the side to add a larger battery charger (or another solar cell). It all worked until my wife needed to replace the house alarm battery and used the only one at her disposal. Oh well ...one day I'll get back to it.

Seems like the Tiny Tracker would allow more room in the box.

It could take months to explain all the possibilities that have been discussed about this subject on the APRS SIG (TAPR APRS Special Interest Group Mailing List). You can (kinda somewhat) do a search through their archives or you can join the fun at https://lists.tapr.org/mailman/listinfo/aprssig

Some times you have to read the comments with a proper perspective. That perspective being that we are all volunteers (in a fashion) working on a Hobby that we all passionately love and that we will never all agree on. Phew that was a wordy sentence. If you get their search engine to work right you might want to write a how to about your experience. :-D

Does APRSdos do that? If anything does, I think it would. What kind of interface does the rotor control box take? Sounds like a good idea for a feature to add to my new tracker. It's already got the code required to decode incoming positions and calculate range and bearing. If the rotor controller takes serial commands, that would be pretty easy to do.

This is KB1JNW, Eric, located in Hamden, CT. I am having some difficulty in my APRS station, and I am looking for some guidance. I am using an IC2720, and a Tiny Trak3. The setup had been working before, continued while I lived in Florida, however now that I have come back up north, I no longer appear on findu. I also have checked and I am not in any of the errors on the site that I can tell. The TT3 does key up the IC2720, and it does show valid GPS data.

I am using the following digipath setup with the TinyTrak3

RELAY,WIDE,WIDE3-3

And then the alternate digipath is:

WIDE,WIDE3-3

It is set to alternate, the first has a call of KB1JNW, the second is KB1JNW-2

Any help would be appreciated!

-Eric

Please keep in mind do to a lot of packets being generated by RELAY, WIDE. A lot of Digipeaters today are filtering the RELAY, WIDE out so what this means is that when you think your station is going out over the network it is not. WIDE2-2, WIDE3-3 or W2-2, W3-3 are the preferred paths.

Please keep in mind that depending on how much APRS traffic is in your area determines if you should be using the WIDE 2-2 or 3-3.

This is KB1JNW, Eric, located in Hamden, CT. I am having some difficulty in my APRS station, and I am looking for some guidance. I am using an IC2720, and a Tiny Trak3. The setup had been working before, continued while I lived in Florida, however now that I have come back up north, I no longer appear on findu. I also have checked and I am not in any of the errors on the site that I can tell. The TT3 does key up the IC2720, and it does show valid GPS data.

I am using the following digipath setup with the TinyTrak3

RELAY,WIDE,WIDE3-3

And then the alternate digipath is:

WIDE,WIDE3-3

It is set to alternate, the first has a call of KB1JNW, the second is KB1JNW-2

Any help would be appreciated!

-Eric

Great advice Mark...but I think you forgot he is a mobile user. Mobiles are using WIDE1-1,WIDE2-1 or in the boonies WIDE1-1,WIDE2-2.

Quoting "ke4kmd (Mark)" <ke4kmd@...>:

> Please keep in mind do to a lot of packets being generated by RELAY, WIDE. A

Do not use Relay, Wide this causes more packet information on the network.

As for the Callsign it looks like you are trying to digi to yourself. Find a digipeater in your area and set the path to it instead.

For example. XX1XX-10, Wide3-3

Please keep in mind the X's for example only. This would be your Digipeater in your area with the SSID at the end.

Hope this helps you.

Still no luck so far...I do not believe I am trying to digi to
myself...however does anyone else want to jump in on that?

I changed my path settings to
WIDE1-1,WIDE2-1

and the alternate

WIDE1-1,WIDE2-2

Both now have the same callsign, KB1JNW

I checked into local APRS activity by my zipcode (06514) and I am
finding these for RAW data:

KA1RRS-9>APT310,KB1AEV-15,NE2E-15,WIDE2*

K1LEF-4>T1SP9X,KB1AEV-15*,CT2-1

WA1LOU-8>T1SP2Y,KB1AEV-15*,WIDE2-2

WA1LOU-8>T1RY1T,WA1LOU,WIDE1*,WIDE2-1

FYI My QRZ.com address is incorrect...

Why would you use your own callsign in the unproto path for your mobile?
The normal unproto path for a mobile user in the USA and Canada would be, as far as I have understood from path discussions through the last 18 months:
APRS,WIDE1-1,WIDE2-1
or, depending on the local network,
APRS,WIDE1-1,WIDE2-2 (to get out with 3 hops)

Then it is of no importance at all which real callsign is behind the digis.
(I don't know the particulars of the TinyTrak, and as I understand that you are asking similar questions in a group for TinyTrack, I hope that the combined replies here and there will get you on the right track)

The TinyTrak does NOT need the "APRS" at the start of the path statement.
That peculiarity is, as far as I know anyway, only with UI-View.

Other than that, you are correct Jan.

WIDE1-1,WIDE2-1 is the standard path for mobiles anywhere in the US and
Canada.

WIDE2-2 is the standard path for home stations.

And yes, Eric got those same answers on the TinyTrak list so hopefully he's
got it figured out now.

OK.
Yes, in UI-View, the destination address is included in the unproto path. E.g. in the D7 radios and obviously also in other devices and software, there is a separate menu item for the destination address.

Just a note of clarification.
Quoting "Jan T. Pharo" <jan@...>:

> The normal unproto path for a mobile user in the USA and Canada would
> be, as far as I have understood from path discussions through the last
> 18 months:
> APRS,WIDE1-1,WIDE2-1

The statement above would be correct if it is MYCALL APRS VIA WIDE1-1 WIDE2-1. It would be incorrect if it is MYCALL ANYCALL VIA APRS WIDE1-1 WIDE2-1. I was just concerned that some Newbie would do the settings with APRS in the VIA path after the UNPROTO command. Each program will do it a little bit differently VIA is what you'd find in a Kantronics TNC. UI-VIEW lists the area to put WIDE1-1,WIDE2-1 as UNPROTO Address. I know because I tried it once or twice as a Newbie. By the way I'm still a Newbie it's just that I'm a little bit older of a Newbie now. :-D

No, as said in another couple of messages up the thread.
The part "APRS" is the destination, and in Eric's TinyTrac, the
destination is entered in another place.
MYCALL or the sender's own call won't have any place in the unproto
path at all.
My example is to APRS via WIDE1-1 and then WIDE2-1, and in TinyTrack
the path will be entered as WIDE1-1,WIDE2-1 (as far as I understand it
from another poster)

3564. New FreeTrak release

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-22 01:52:19 UTC
From: n0qbh
Topic: 3564 Message: 3564

I recently upgraded the firmware for the FreeTrak APRS tracker.
It now has the mic-e compressed position report option.
I've also redesigned the encoder hardware to output a cleaner signal
and reduce current consumption by 1/2.
The new firmware is compatible with both the new and old hardware
versions.

http://www.ringolake.com/pic_proj/gps_trak/freetrak200.html

A ham friend of mine is working on a pcb layout for the new design as
well and is likely to sell them quite reasonably.
I'll keep the group posted.
73,
Mike N0QBH

3565. RE: [APRS] New FreeTrak release

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-22 02:53:33 UTC
From: scott@opentrac.org
Topic: 3564 Message: 3565

I'd never noticed that the pic16f628 had a D/A output. I wonder why the TinyTrak didn't use it - maybe because of the same issue with the low drive level?

My first OpenTracker prototypes had a resistor divider like the TinyTrak, but for flexibility and to save I/O pins I went to pulse width modulation. It was a pain to set up, but it's given me the ability to do PSK-31 and provide a software configuration option for transmit audio level. Not sure if the PIC's timers work quite the same way, but you might look into it. There's no buffering required, and you could use the VREF output and a transistor to implement an audio level control, even if the timers don't have the speed or resolution to do that.

What sort of form factor is the PCB going to be in? Is it designed for a specific enclosure? Does the PIC allow flash self-programming, or does it need an external programmer? Do you find that the tolerances on the ceramic resonator are tight enough, or is there a software adjustment like on the TT3?

Anyway, good luck - I don't envy you the amount of PIC assembly code you've got to maintain!

Scott

3566. Other APRS devices.

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-22 05:13:59 UTC
From: Paul Lee
Topic: 3566 Message: 3566

I am looking at "nearby" APRS activity and see things like certain weather stations and other devices (like http://www.findu.com/cgi-bin/find.cgi?call=SPCD_1174) that do not have a amateur call sign. Why are they showing up on APRS frequency? How do they work?

3567. RE: [APRS] Other APRS devices.

In all likelihood, they are not showing up on the APRS frequency. They are simply showing up on the APRS Internet System, the APRS-IS. Citizen weather stations are very numerous (call is CW####), and you will find objects posted for various things (earthquakes, fires, water gauges, storms, etc). These are available to be selectively gated out to RF by iGate operators, but otherwise they do not appear on the RF side.

Go here <http://wxqa.com/index.html> to learn more about the Citizen Weather program.

BTW, it's good practice to give your own callsign when posting to an Amateur Radio group. Helps the rest of us tailor our answers to the area you may be located in.

3568. Less Digis in the Area? Setting up IGate

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-22 11:00:00 UTC
From: Eric
Topic: 3568 Message: 3568

Hey guys, I will just post this here and try to to rustle many feathers...

Thanks for all the help getting my TT3 back up and running, however I am now finding that the covereage for APRS digis and IGates does not seem to be what it used to be around here. Previously, I was able to track my movements down to a few feet of accuracy, however now my coverage appears spotty, and non-existant along the shoreline of CT.

Here are a few of the raw packets comming into findu...

```
KB1JNW>T1QY3P,N1RHN-15,NE2E-15,WIDE2*,qAo,K3JSE:`dQ0qrAv/"41}
KB1JNW>T1QY3P,KB2EAR-1,WIDE2*,qAS,N3XKU:`dQ0qrAv/"41}
KB1JNW>APT311,KB1AEV-14*,WIDE2-2,qAR,N1OFZ-15:>Oppie's Mobile
KB1JNW>APT311,KB1AEV-14,NE2E-15,WIDE2*,qAo,K3JSE:>Oppie's Mobile
KB1JNW>APT311,WA2JNF-15,N3XKU-15*,WIDE2,qAS,N3XKU:>Oppie's Mobile
```

If I am correct, the first callsign in the packet, after mine, is the first digi that hears me, after that, the second digi, and then the last is the IGate station that put me out to the internet...seems as though none of them are in my usual travel area!

I did a lookup by zipcode (06443) for stations in the area...there were a few WX stations...however no IGates or Digi's as far as I can tell. If there is a better way to see this, I would love to find out where the coverage went!

Also, is there a way to setup an IGate using a scanner rather than a radio? If one uses a sound card TNC, couldn't this be setup? I am at setting up an IGate/Digipeater in my town of Hamden CT, I am up on a large hill on the 6th floor of the building.

Thanks to the keen eye of a builder, I discovered an error in the busy detect circuit and have since corrected it and uploaded the updated files to my webpage.

http://www.ringolake.com/pic_proj/gps_trak/freetrak200.html

Sorry for any hassle this might have caused.

Hi Eric;
the first item after your callsign is an indicator of the system sending the packet. It is a system-generated translation of "APRS" in your destination.
You will be able to find the location of the callsigns in the path at findu. E.g. <http://map.findu.com/N1RHN-15> gives me this report: Position of N1RHN-15 --- 1.8 miles southeast of Ansonia, CT, not far away from New Haven where you were with your car as I was looking you up just now.

My tracker is designed for spartan simplicity. Most as a result of
requests from third world hams who have a hard time getting digital
gear and wish to roll their own for a minimum of cost.
The OpenTracker PWM method looks interesting. Did you have any
problems with harmonic artifacts? A friend of mine was designing a
tone generator using a PIC w/PWM and ran into that problem.
As to the pcb, I haven't seen it yet and it's not designed for a
specific enclosure.
I haven't noticed any problems with resonator tolerances either.

> The OpenTracker PWM method looks interesting. Did you have any
> problems with harmonic artifacts? A friend of mine was designing a

No, even in PSK-31 mode it's been pretty clean. The PWM carrier is currently at 57600 hz, which puts it well outside a radio's passband and makes it easy to filter. It's using 8 bits of resolution is PSK-31 mode and 7 bits in AFSK mode. If you turn the software audio level setting way down it'll start to degrade because of the loss of resolution, but it's really not noticeable until it's reduced to the equivalent of 2 or 3 bits of resolution.

The HC08 has a hardware multiplier which lets it do the 8x8 unsigned multiply operation for the audio level control in a single instruction. That might be a little harder to pull off in a PIC.

> tone generator using a PIC w/PWM and ran into that problem.

This also depends on how it's used. If you just set the PWM module to 3 kHz to produce a 3 kHz signal, you're going to get a square wave with all of its harmonics. You have to run it much faster and feed it sine wave samples like I assume you're doing with the 4-bit D/A. Also, you have to be careful not to set the PWM registers at the wrong time, or you may get a glitch, depending on how the hardware works. The HC08 has an option for buffered PWM output, so the timing's not as critical but you have to switch back and forth between two output registers.

> As to the pcb, I haven't seen it yet and it's not designed for a
> specific enclosure.

Just something to keep in mind. I like the PacTec CNS-0101, and I use it for the OpenTracker 1x. It's cheap, it's got a fair amount of room inside, and it takes two DB9 connectors without any modifications. All I have to do to them is drill a single hole for an LED... much simpler than the milling operations required for the Serpac C6 cases.

What I do find interesting is I opened up AGWTracker and I see there are multiple Digi's in the area...however none of them appear to be recieving my signal. I am currently in Zipcode 06443, and nothing is recieving the signal.

the WA1LOU Digipeater should be picking up all my signals...however I see that it has only recieved it twice (at least reported to findu) interestingly enough, it is only recieveing those on the alternate digipath of WIDE1.

Then the digipeater might not respond to the first part of your
unproto path.
You zipcode doesn't tell me much. But if you go to the link
<http://map.findu.com/KB1JNW>, and then select "Nearby APRS Activity",
you will find the nearest APRS Stations to your station (given that
KB1JNW is your callsign).
>
>the WA1LOU Digipeater should be picking up all my signals...however I
>see that it has only recieved it twice (at least reported to findu)
>interestingly enough, it is only recieveing those on the alternate
>digipath of WIDE1.

So what is the unproto path in your setup now? It seems that you are
being digipeated first by KB2EAR-1:
|| KB1JNW>T1QY3P,KB2EAR-1,WIDE2*,qAS,N3XKU:`dQ0qrAv/"41}
If WA1LOU doesn't digi on the first element in your unproto path, the
reasons probably are..
- it doesn't hear you;
- it digipeats on another alias or callsign than the first element in
your unproto path.

<Also, is there a way to setup an IGate using a
scanner <rather than a
<radio? If one uses a sound card TNC, couldn't this be
<setup?

Yes, you can do that. I had an Igate running from a
scanner to sound card through XASTIR (Linux version)
for about a year then switched it to a TNC and
tranceiver for better functionality such as the
ability to transmit and fill-in digipeat.

The sound card tnc needs the audio input level from
the scanner properly adjusted and it should work fine.
Setting up XASTIR may be a little more cumbersome
since the version I am using here is Linux based and
running on a seperate dedicated PC. You may want to
look around for a wondows based app.

I have an unused GPS 35 HVS for sale. The cable has been cut to a shorter length (perhaps 18"?) but I have the rest of the original cable as well so it can be reconnected within the unit. I also have a printout of the manual that I will include. This is the HVS version, which takes an unregulated 6 to 40 VDC as power. Full specs are available on the garmin site at:

http://www.garmin.com/products/gps35/

Make me a fair offer and it's yours.

There was an article in QST a year or two ago that showed a microtracker? mounted in an altoid tin and attached to a dog (rescue dog?). I'm sure that article has answers to most of your questions.

Hello Scott
I have found is the EZ-rotor made by Idiom Press.
It is a RS-232 board and it uses HyGain DCU-1 protocol on a 9 pin plug
This would realy cool if it will drive the rotor.
The plan is to transmit APARS on 2m and to track the airplane's ATV
signal with the APARS driven rotor contoler.
Had any luck getting it to work ?

If you are looking to just send out packets of your position then one of the HT's will be fine.
I had a bicycle tracker setup that consisted of one of my Tiny Traker II, 2M Alinco HT, a Larsen 2M/6M antenna and a GPS.

Later I moved the setup to the Motorcycle, it worked well on both, on the peddle power I used a 12AH gel cell batt, it lasted for 3 to 5 hrs without any issue.

I spent a couple of hours last night on the distance/bearing calculations. Got them to work, but they're way slower than I'd like with all of the floating point math. I'm going to try rewriting and optimizing them.

Once that's done, it'll be relatively easy to add an automatic tracking function. It'll just spit out a rotor control command every time it receives a new packet from the station being tracked.

Ok Cool beans !
I thought about the update speed too .
Looking at the beam width of the yagi that we are useing and knowing
the distant that the aircraft the normaly flys and the speed.
I would say it would need to move about every 10~15 sec just to keep up.
Hopefuly it will update as fast as it gets a new update
That is if the craft is flying perpendiclar to RX site.
I wounder if the update speed could be made adjustable?
Say if the last know possision is less than XXXXX then don't move
Well just a thought.

3584. APRS In Houston?

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-28 00:47:23 UTC
From: Josh Keller
Topic: 3584 Message: 3584

I'm moving to Texas for work and have been in SW Houston for a few months. I have my VX-7R with me but have not heard any APRS activity. I will be moving to Austin in 2 weeks, how is the activity there? At home in Oregon it was all over the place, I expected even Move activity down here considering the much larger population.

Am I missing something?

Thanks,
Josh

3585. Tracking a hot air balloon

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-28 08:07:50 UTC
From: must_dash2000
Topic: 3585 Message: 3585

Newby questions, lots of advice needed.

I fly hot air balloons and have been looking into ways of tracking the location of the balloon from the retrieve vehicle. It seems that the APRS is best. The concept is that the balloon would transmit the position signal, this bit I understand (still working on which frequency band to use).

Obviously the signal is received by a radio, how is it processed into a position that can be shown on a laptop. What is the best street level mapping software that we can use, I will need to show at last 2 positions.

We don't want to have to use SMS, GPRS or similar internet access due cost.

I live in the northwest of England.

Any suggestions or alternate ideas?

Thanks

Tom

Just checked several Digi's in and around Houston and all are still RELAY,WIDE. Can't figure out just which one covers how much either because I couldn't find any Digi's with PHG data. I haven't looked but I'm suspecting that Austin will be the same story. From some of the packets I've seen that make it to Nebraska from TX it would appear that RELAY,WIDE is the norm for large parts of TX.

> position signal, this bit I understand (still working on which
> frequency band to use).

Assuming you're a licensed ham, you can run the tracker on the national 2-meter APRS frequency (144.39 in the US, 144.80 in Europe) and take advantage of the existing digipeater and Internet gateway infrastructure.

You could also use a separate frequency and avoid congestion. Transmitting very frequent position reports on the shared APRS channel is discouraged, especially if you're airborne. If you're on your own frequency, you can transmit as often as you want. 2 meters is popular because of its propagation characteristics, and the 440 band would probably be fine for balloon use.

> Obviously the signal is received by a radio, how is it processed into
> a position that can be shown on a laptop. What is the best street
> level mapping software that we can use, I will need to show at last 2
> positions.

Two positions from the same station, or two stations? As for how to do it, easiest (cheapest) way is to run a software modem program like AGWPE and pipe the received audio straight from the radio or scanner into the laptop's audio input. There are several APRS mapping programs you can use to display the received data, including WinAPRS, UI-View32, and Xastir.

You can also use an APRS-ready radio like the Kenwood TM-D700 mobile or TH-D7A handheld. You can use those with an APRS mapping program, or connect them to a mapping GPS receiver and they'll plot received positions as waypoints. Or you can wait a month or two and buy my new tracker/TNC, which will do that but with proper symbols, altitudes, and comments, assuming you've got a supported Garmin or Magellan GPS receiver.

Hope that helps,

Scott

3590. RE: [APRS] Re: Antenna rotor controler for APARS

Yahoo group: APRS (1998 — 2006)
Date: 2006-06-28 17:56:32 UTC
From: scott@opentrac.org
Topic: 3547 Message: 3590

Assuming you're on a dedicated frequency, you can transmit every 5 seconds if you want. I'll just set it up to output a rotor command every time a fix is received.

It could be made to do dead reckoning every second, estimating the plane's position based on its last position and velocity. I'd rather not have to do that, though.

Scott, thanks for the info.
I didn't believe that 2m was legal when airborne. We would also be making frequent position tx in order to create a snail trail on the map, hence we would want to keep away from regularly used frequencies. The minimum number of tracks would be 2, the vehicle itself and a balloon. However this is not to say that we would not want to track more balloons later (which would really congest the frequency). The vehicle input would be a straight USB GPS feed.

What APRS mapping program would you recommend for UK? We have been using memory map and Oziexplorer, but they will not accept a second position input. Ideally we would want 1:50,000 or 1:25,000 scale topographical maps

Hmm, in the UK it might not be - I've heard there are more restrictions there on airborne transmitters, but I don't know the law myself. Forgot about that.

> hence we would want to keep away from regularly used frequencies. The
> minimum number of tracks would be 2, the vehicle itself and a

That should be no problem for any APRS app.

Check out OziAPRS. I haven't used it in awhile, but it interfaces with OziExplorer and will probably do what you want.

You might check on the Yahoo Balloonatics group for more information on UK legal issues. It's mostly an unmanned ballooning group, but there are some knowledgeable folks there.

There is APRS in Houston but more activity in Austin. I'm told that the greatest concentration of APRS activity is in Dallas, though.

Our group (TEAC) is preparing to install an APRS digi and I Gate in the NE quadrant of Houston in the very near future. That should help some.

Call me old fashioned, but sometimes I like to have a "real" document in my hands, printed pages that I can put physical bookmarks in! (-:

I have a print out of "APRS101m.PDF" that has been a good reference in my early experiences with APRS and still provides me with useful information. This document is dated April 30, 2000.
Has there been an updated .PDF file compiled that is more recent? I've done a bit of a search and haven't found anything.
Can someone here point me in the right direction?
Regards,
Michael.

Will it be a WIDEn-N Digi? Most of the mobiles I randomly selected in the Houston area are still running RELAY,WIDE, so I'm suspecting the Digi's are too?

3598. RE: [APRS] APRS In Houston?

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-01 05:38:43 UTC
From: Frank Hormann
Topic: 3584 Message: 3598

Since we plan this station to be an I Gate as well as a digi, our plan is to go with only Wide1-1. As I understand current thinking, the push is to get away from Relay,Wide.

I am open to suggestions, though.

Frank K M 5 I

3599. RE: [APRS] APRS In Houston?

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-01 07:14:15 UTC
From: Stan - N0YXV
Topic: 3584 Message: 3599

Without knowing more about your network it sounds like you have a good plan. What you set your IGates at depends a little bit on how many IGates and Digi's you have and what coverage area they cover. If you have 2 or 3 IGates in a similar area with similar or same coverage you might want to consider making one or more into RF receive only IGates with no RF transmit. In other words you'd take packets from the RF and add them to the APRS-IS system but you wouldn't automatically gate packets from the APRS-IS to RF. We have several IGates in our tiny town but only one of them transmits to RF all the others are set as receive only. Then we have another IGate we use to transmit but it only sends out WX information. I have my IGate/Digi setup as a receive only IGate and a backup Digi. If my station hasn't heard the main Digi for 30 minutes it then automatically switches into full blown Digi/IGate mode. Other than that it's just a receive site to forward packets to the APRS-IS with no Digi capability.

Your choices of WIDE1-1 makes a lot of sense too if you think of it as if it was an RF signal (it's not but for comparison). When you access a repeater the rule of thumb is to use only the power necessary to get to the repeater and no more. Your extra power might just wind up QRMing somebody else. Same thing holds true for path selection. Use the lowest numbers possible to get the job done. First you have to define what your objective is. If all you want to do is get packets to the internet (APRS-IS) then find out how far away from an IGate you are via hopes (Digi's) and enter that number into your WIDEn-N setting. If you are 2 hopes away from an IGate you'd use WIDE2-2. If your goal is to reach your buddy that doesn't have an internet connection half a state away then count the Digi's between you and him and use that number. Most states a WIDE3-3 will completely cover. Now if your buddy on RF only is one hop from an IGate you might not need to reach him directly via RF but instead if you can make it to a local IGate on RF the APRS-IS system will back haul the packet from your RF station through the IGate and back out onto RF again near your buddy. That way you don't have to enter a path like WIDE7-7 to send a message to your brother-in-law three states away from you. The national recommendation is to always use something less than WIDE3-3. Mobiles in a WIDEn-N setting would use WIDE1-1,WIDE2-1 or in really remote areas WIDE1-1,WIDE2-2. The WIDE1-1 simply replaces where you would normally put the word RELAY and WIDE2-2 replaces the word WIDE. At least that's the concept in a very short nut shell.

For a more complete understanding try this link.
http://eng.usna.navy.mil/~bruninga/aprs/fix14439.html

or you can try the newest information hot spot
http://info.aprs.net/wikka.php?wakka=APRS
This is a WIKI formatted (if you don't know what WIKI is try Googling it) set of pages that you can read or add your own knowledge to. Information on this site grows daily at times. I'd stick to one of the two links above for

WIDEn-N information because there are still a LOT of web pages (and user manuals) that have wrong or old setting data still posted as if it was correct and current.

So I'd do what your suggesting and wait several days to see the results. If it gets the job done leave it set to WIDE1-1 if you find holes that don't work then maybe consider bumping up to WIDE2-2. It's a lot of trail and effort to make sure you can get your system setup so that everybody that wants to get in can without clobbering somebody else's packet. In a perfect system you'll lose a packet or two now and then. In a badly setup system you'll lose a lot of packets and so will neighboring towns and the towns that neighbor your neighbors. APRS only has one frequency and what you do in one part of the nation can wind up in another state completely. I live in Central Nebraska and I'm presently getting packets on a some what regular basis from Texas already (not to mention IN,IA,MO,KS,AR,& OK). Doesn't mess up my tiny APRS network so it's not a big deal for me but if Texas packets can make it to Central Nebraska just how much further can they go East and West?

Sorry I'm rambling way to much now....must go to sleep....must go to sleep.....

3600. WinAPRS Support Group

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-02 11:29:10 UTC
From: Beischel
Topic: 3600 Message: 3600

To those WinAPRS users out there looking for their own group, a WinAPRS group has been established on Yahoo Groups.

http://groups.yahoo.com/group/winaprs/

We have recently invited the Sproul brothers and so far Mark has dropped by and agreed to participate. He has already provided us with some helpful suggestions to some of the issues raised in the group.

WinAPRS is an excellent product, so if you are using it or thinking about using it, then please join he group.

Regards,

Duffy

Try the UIVIEW Yahoo group...
Description
Support and discussion of G4IDE's UI-View software.
Sales messages should not be posted to the group.
Please try to stay on topic. If in desperation you need to seek the help of the list
on other radio matters please mark the posting OT and request direct replies.
******************** Important Please read ************************************
For registration, please scroll to the bottom of this page and click the "Related link".
The registration procedure applies for new as well as for lost registrations, and for APRS
server validation codes.
Do not send an email to your previous registrar.
Precision Mapping version 7 will work with UI-View32. The necessary additional PMapServer7
is available
for download at http://www.ui-view.org.
Please note that the Precision Mapping software is a separate purchase and should be viewed
as a very useful add on
rather than required for ui-view to work. It will cover USA and Canada.

From: Shola Ogunlokun
Topic: 3585 Message: 3604

I would be interested in knowing the answer to this as well, as I could use APRS to allow others track me on my forth coming adventure.

I rememember sometime ago APRS being used on board some un manned ballons that were launched from the UK, but don't know if special permission was garnted by the CAA to allow this.

3605. RE: [APRS] APRS In Houston?

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-05 01:10:41 UTC
From: Frank Hormann
Topic: 3584 Message: 3605

Thanks for the comments. Our intended location is in the NE Houston quadrant where there is no I gate or digi coverage at present. . This is a new endeavor for our group and a learning experience in addition. I edited UIView32.ini to make the digi compliant with the new WIDEn-n paradigm and Abusive Path Trapping paradigm. We'll see where this configuration takes us to start with and can always edit it if looks appropriate in the future. For the I Gate, we will probably try gating Internet messages to RF once the rest of the installation is operational for a while. I am hopeful that the system will be in continuous operation before the end of July. I'm open to all comments or suggestions.

Sounds like your 100% on the right track. Especially the comment about being open to all comments or suggestions. The only way APRS is going to stay a viable Amateur Radio format is if we don't bash each others ideas and can stay open to ALL suggestions. It's not like there is only one correct way it's more like there are one or two really good ways and several others that make good options.

3607. Gpsmap 276c to D7a

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-04 15:55:19 UTC
From: Chris Pope
Topic: 3607 Message: 3607

Has anyone had any luck hooking up garmin gpsmap 276c to Kenwood D7a?

3609. Re: Gpsmap 276c to D7a

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-08 01:39:26 UTC
From: n3hu
Topic: 3607 Message: 3609

Jim/Chris,

Can't claim credit for this one. I got it off of
eham but I had problems at first. The documentation from
Kenwood is lacking, to say the least, on the setup.
bectha anything that the problem is at that end, not
the GPS (although that is covered too). Even though
this references a Vista, the setup should be close
for a gpsmap. Anyway, here 'tis:

rob n3hu

I, too, use a Garmin eTrex Vista with my TH-D7A(G). So, I should know
a thing or two about this!(lol) The manual suggests (and I follow to
the letter) is to make sure the devices are turned off before
attaching them. Turn the GPS on, then turn the HT on. When the HT is
ready, push the TNC button once. If the BCON letters don't appear just
to the right of the TNC icon, you must push the BCON button. At that
point, you should see TNC====== BCON. If you see the word packet
(TNC====== PACKET), you've pressed the TNC button once too often. Turn
it off then turn it on again by pressing the TNC button (once only) again.

If that doesn't work, make sure you go to menu setting 2-C (APRS Menu)
and ensure that DATA TX is set to AUTO. MANUAL/PTT will not send data.
Go to menu setting 2-D, where you can set the time intervals for auto
transmit.

Although the latter information is based on the HT only, (meaning, it
has nothing to do with data flow between the GPS and the HT), it may
help solve other issues.

Also, check menu setting 2-2... Make sure that this is set to NMEA -
as well as the GPS. If they don't match, they won't understand each
other.

The schematic for the microphone is available for download in the files section of the FT-8800R yahoo group, it clearly indicates the pinouts. Though if you are planning on using the FT-8800R for aprs or packet in general, I would suggest that using the rear mini-din connector is preferable to interfacing through the mic and speaker connections.

Hope this helps.

Sorry can't help with the PK88 and AGWPE but I know they work well in KISS mode with Javaprssrvr. I own two of the PK88's and love them, although they do get a little hotter than I'd like. At least the heat doesn't seam to affect how they operate. If you need something from the manual I have a complete original manual for the PK88.

Ed,
Any GPS receiver that has an NMEA serial port should work. If the GPS
receiver supports NMEA input, you will also see other APRS stations
and objects appear as waypoints on the GPS map screen.

Yeah... I don't remember which servers still accept connections on port 23 though. But some do (maybe all the 1st tier for that matter), you just need to send an authentication string before they'll accept any inputs.

I think I've seen your space launch website before... I built the 30th Space Wing's online launch schedule and got linked from a lot of similar sites. Never could get Public Affairs to approve a page on where to watch the launches from, though. The site's still there, but it's not mine anymore and the public side's been scaled way back since 9/11.

3620. Re: Sending APRS Strings via Telnet

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-16 16:53:49 UTC
From: Dan Ellis
Topic: 3618 Message: 3620

Telnet itself operates on TCP port 23, however you can direct telnet
to use a different port by specifying the port number ie.

telnet host 14580

This would cause telnet to utilize the specified port (14580 in this example) for
communications.

I often use the smtp port (sendmail) to validate systems are capable of receiving mail,
also
use port 80 to insure that the HTTP service is running on a server.

Telnet does try to do some negotiation (DO/DON'T, WILL/WON'T) so you have to
be sure what you're connecting to won't mind some extraneous characters.
But you're right, it works fine for HTTP, SMTP, NNTP, POP3, and so on. And
I've never had a problem with the APRS servers.

Scott, how difficult would it be to use something along the lines of
a "Siteplayer Telnet" which is a serial to telnet converter along
with a tnc and some glue (glue being a small micro to handle signon
and such)to make an Igate that doesn't require a PC?

3623. Wireless APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-17 04:53:27 UTC
From: kg4pid
Topic: 3623 Message: 3623

I've recently been playing with some ethernet to serial converters called "SitePlayer Telnet". By using 2 of these along with a Linksys wireless access point I've been able to create a wireless connection to my TNC (KPC3+) and my GPS (GPS18 LVC). I've been powering everything from an ac inverter in my moble. While I don't have anything permanently mounted yet the results have been very good. I can get into my SUV (or within about 100 to 200 ft of it) fire up the laptop and have UI-View32 running with no wires to the laptop. I plan on building some small power supplies so I can get rid of the ac inverter and the wall warts. Now when I go camping or just to a friends house I can bring the laptop and have APRS running without the mess of wires.

I don't think it'd be that hard. You'd need a micro capable of keeping up with the APRS feed traffic, but you'd probably be running on a message-only port so it wouldn't be all that bad. You might need a fair amount of memory if you want to keep track of stations heard so you can gate Internet-to-RF messages.

I've been thinking about doing something like this for a future TNC project. However, at some point it might make more sense to just build semi-custom single-board PCs pre-configured for packet operation. 12 volt power supply, maybe 512 MB compact flash, a couple of audio interfaces, spiffy case, and a lightweight Linux build with a simplified command interface.

If I only had another 40 hours a week to spare, I could probably do it. =]

Sorry, but at this time I don't have any pictures since I'm trying to decide how I want to package everything. The Siteplayer Telnet modules are used to create an ethernet serial port, much like a regular serial port except there data moves in/out of the laptop thru an ethernet connection. The wireless access point extends this connection a few hundred feet. This could also be extended further with higher gain antennas. Hope this helps.

Hello,

Has anyone,with the proper eprom(UIDIGI)
used the Kantronics KPC-2 Packet
Communicator II as a APRS digipeater?

Got my hands on one and hoping to
use it for a digipeater project.

Thanks for the help!!

>RELAY

Well, as far as I have heard during the last year about digipeater
network structure in the USA, it should get MYALIAS=WIDE1-1 rather
than MYALIAS=RELAY (but that doesn't change the technical limitations
of the device)

Jan
it is long ago,
these new parameters that i saw are applicable not at large,it depends on
your geography
you must play with them and i am not an expert anyway
here we have enough of what we have ,we tried the new parameters they were
not good for us
but encore if we had someone around that knw how to play with them but we
dontJan.

i just came back last night from a remote site,1328 feet high to reinstall a
digi that is use as a backbone for our network , i even had a visitor ,,,a
big black bear

Hallo Gervais;
Well, the "new paradigm" is making some trouble here as well, as some
hams have been talking to some others and then declared that now, all
have to behave as WB4APR and US SysOps in very dense populated areas
have decided. So I expect some trouble for mobiles moving across
borders in most of Europe, which, unlike the US/Canada border, are
open for passing without any stop except for commercial transports.
However, WIDE1-1 eventually will replace RELAY, but in the meantime,
users will have a hard time knowing which digis and home fill-in-digis
respond to which scheme.

I am happy that we don't have these around here :-) (in some parts of
the country, even not far away but on the mainland, there are said to
be some wolves and brown bears; I have never come across any of them)

well
i always thaught that a good software is an adaptable one ,
here for example the Montreal region is flat terrain,if you go in the north
you would have mountains
here in the East side of Quebec we have some mountain that are so high that
they cut the signal so i decided to install a backbone digi that is job is
to Relay data much of the time
and from there .we are working on a network of periferic digi,less
powerfull that would retransmit data to the backbone ,,,,,you see.
i am not an expert in those settings,i rely on opinion to establish mine for
our needs and geographic situation that we have .

as for free travelling there is a passport to be ask soon between canada and
the usa ,,,,,,

black bear are not dangerous except in the reason,if the guy is looking for
an 50%,,,,or a female with his cub .dont climb in the tree ,,lie on the
ground and fake to be dead or you will be ,,,,,,,,,

i never had any problem with them as you respect them as simple as that
,,,,this is there kingdom.

Just wondering why the new parameters were not good for you...that is if you know. My guess is that it wasn't any good because you'd have to get everybody to switch to the new WIDEn-N stuff in a timely manner.

The old RELAY and WIDE had a lot of problem in congested areas (as was pointed out) because it would allow not only local traffic but traffic from less congested areas as well. I live in Central Nebraska and I'm still getting RELAY and WIDE packets from Texas, Oklahoma, Missouri, and a few from Kansas. While I don't have any congestion in my area you could easily see how I could cause problems in other areas if I used RELAY and/or WIDE. If APRS packets in Texas using RELAY and WIDE can get to me I could get to them as well. While the DX'ers loved the thought of traversing the country via packet the local users that couldn't get into their own systems because of high packet counts from outside hated it. Just imagine if you the local mobile APRS user and for every 10 packets you send only 1 counts. That would get old very fast, and in a lot of places seriously threatened to end APRS for ever. Why would you want to be involved in an aspect of Amateur Radio if that mode didn't work but 10% of the time?

Basically with RELAY and WIDE there is no built in system to get them to stop. As long as another Digi can hear the packet it keeps right on going. Under the old RELAY and WIDE they counted on collisions (information lost) to stop the packet from traversing the country.

Sorry I'll get off my soap box now. I do realize that there are exceptions to the rules but too many people are making the exceptions the rule. I do also realize that the original poster does lives in a country other than mine so that increases the likelihood that they _would_ have to operate under the exceptions and not the rules we use here in the US.

Yes as long as your using it with a computer any TNC will do. It may or may not work by itself as a stand alone Digi (TNC + Radio no computer). I'm assuming it's the non + variety which would almost certainly make it not available for stand alone installation but connected to a computer running APRS software it would make a fine IGate.

Dan,
do you have the version of the firmware of the kpc3?

connect your pc ,via hyperterminal for example,talk to the tnc,you should
have a prompt like:
kentronics,,,,,,,
version software or something like that,,,version 6.0 or else

my digi's are running on version 8.2 here

3640. UIVIEW & WX STATION

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-21 23:38:28 UTC
From: Kerry
Topic: 3640 Message: 3640

I am running uiview and a Peet Bros. weather station that has been working fine. I had to install it on a different computer and now my call sign and my weather do not show up on neighboring stations monitors. It does however show up on my own. I can send messages to other stations and it works fine, but my call sign and station location does not show on anyone's screen but mine. I can receive other local stations and they show up on mine also.....thanks

You should update those stand alone Digi's. Here's part of a service bulletin from the Kantronics Web site at:

http://www.kantronics.com/support/kpcbulletin.html

The 9.1 version of the software is the only version that correctly does duplicate checking.

KPC-3+ / KPC-9612+ Service Bulletin
Notice to Kantronics Customers
Owners of Kantronics KPC-3+ and KPC-9612+ radio modems with version 9.0 software:

Kantronics has recently become aware of an anomaly in the version 9.0 software for KPC-3+ and KPC-9612+ units. The anomaly is only in APRS DIGI applications. In the APRS DIGI application, UIDUPE, UIDIGI, UIFLOOD, and UITRACE did not provide duplicate checking for APRS packets as originally designed.

Kantronics is offering a new version of the KPC-3+ and KPC-9612+ software, version 9.1, to address the problem. The new version is available under the following terms:

KPC-3+ and KPC-9612+ units purchased on or after May 12, 2005, with version 9.0 software, are eligible for a free update from the factory. Warranty registration and proof of purchase receipt will be required. Requests for updates under these terms must be made by September 12, 2005.

KPC-3+ and KPC-9612+ modems and version 9.0 EPROMs, purchased between May 1, 2003 and May 11, 2005 are eligible for a free update from the factory, with a minimal fee of $5.00 per update for shipping and handling. Warranty registration and proof of version 9.0 ownership* will be required. Requests for updates under these terms must be made by September 12, 2005.

KPC-3+ units with version 7.0, 8.0, 8.2, or 8.3 software and KPC-9612+ units with version 8.0, 8.2, or 8.3 software are eligible for update to version 9.1 for $25/unit, plus a $5.00 fee for shipping and handling. Requests for updates under these terms must be made by September 12, 2005.

After September 12, 2005, version 9.1 EPROMS for KPC-3+ and KPC-9612+ modems will cost $40 per unit, plus $5.00 for shipping and handling.
The new (version 9.1) software does not offer any feature changes other than providing duplicate checking for APRS packets in the APRS DIGI applications.

*Proof of ownership of Kantronics KPC-3+ version 9.0 and KPC-9612+ version 9.0 may be provided in the form of purchase receipt or photo copy of the

printed circuit board showing the EPROM label, along with a copy of the
serial number on bottom of unit.

*Additional shipping cost to ship to AK, HI, and International customers
will apply.

Not sure there is enough information for a complete diagnosis.
Some Questions:

Is this connected to the internet or is it a stand alone RF setup?
If it's connected to the internet do you have your "Validation number" setup correctly under "APRS Server Setup" in the "Setup" menu?
If it's connected to the internet and a radio does the TX light come on when you send a message?

3644. RE: [APRS] UIVIEW & WX STATION

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-22 05:29:51 UTC
From: Ron Cluster
Topic: 3640 Message: 3644

Make sure your unproto path in UI-View begins with APRS.

Example: APRS,WIDE2-2

Other programs do it differently by having the destination call (APRS) in a different field. UI-View combines the destination call and the path in the same field. If you just have WIDE2-2 in the Unproto address field for instance, that means to send to the destination "WIDE2-2" (which no other APRS client will understand) using no path (which means you don't get digipeated by anything either).

If you look at your transmitted packet, you will notice that UI-View changes the APRS to something like APU25N. That is normal. It's actually just the AP part that is important, the other characters are used to indicate which client you are using.

3645. Antenna question

Yahoo group: APRS (1998 — 2006)
Date: 2006-07-23 06:44:58 UTC
From: Paul Lee
Topic: 3645 Message: 3645

Got a Kenwood D7(g) running a tracker. Works fine. But I am only using a rubber ducky. The original ducky that came with the D7 was dual band about 12" long. I got another ducky about 8" long that is specifically for two meters. Which will be the better antenna for transmitting APRS?

3646. GPS compatibility

Hello,

I was wondering anyone knows of a list of compatible GPS models (serial capable, etc)? I know of the Garmin 18, but was looking for an inexpensive full unit to use standalone and sometimes with APRS.

Anyone have any suggestions?

Thanks,

Bryan, KE7EZE

3647. RE: [APRS] GPS compatibility

From: scott@opentrac.org
Topic: 3646 Message: 3647

It'd really be too many to list. Just about any consumer GPS with a serial interface (not USB) will work. And what you consider APRS compatible depends on what you're using - my new tracker speaks Garmin binary protocol as well as NMEA, for example.

And it depends what you consider inexpensive. I'd suggest a Garmin eTrex (not the color ones with USB only) or Geko for a small handheld unit. I like my GPSmap 60CS - it has serial and USB, plus a larger color screen. I think they're still over $300 though.

Subject: [APRS] GPS compatibility

Hello,

I was wondering anyone knows of a list of compatible GPS models (serial capable, etc)? I know of the Garmin 18, but was looking for an inexpensive full unit to use standalone and sometimes with APRS.

Anyone have any suggestions?

Thanks,

Bryan, KE7EZE

Agree with Scott: too many to list.
For standalone (or "holdalone") use, you wouldn't want an 18 anyway,
'cause you'd wish a display (for setup, for display of your own
position...)

Some of the GARMINs which now come with a USB cable (which cannot be
used with APRS gear), can use serial cables as well. I have
particularly asked about the GPSMAP76CS; answer: if you have a serial
cable with the round connector for the back of the 76, it will also
work for the new model.

A piece of wet string is better than the original antenna that came with the D7. The aftermarket antenna is probably better, but it depends on the specific antenna.

Well thanks everyone for the replies. I ended up getting a Garmin Etrex Legend (which came with a serial cable). I was only looking at the 18 for dedicated APRS use later on.

I'm curious though, has anyone ever seen a serial to USB adapter (I've only ever seen the opposite)? If so maybe something like that would work?

Thanks,

Bryan, KE7EZE

No - there's no general way to convert USB to serial. You'd have to have a USB host controller (a fairly complicated chunk of hardware) and the appropriate drivers for the device it's talking to. USB is a much more complicated protocol than RS-232, and it's entirely host-driven.

Thanks Scott, The top of case is totally perforated, as it was an old o'scope with tubes, but I will monitor temp to be sure.it's ok.
The arrangement puts the D700's ant. connector deep in the middle of the case. My plan is to run a short piece of coax from the D700 to the inside of the case, terminating in a through fitting coax connector, so that I can change and detach antennae at the case, not inside. I am concerned if this might cause harmful RF to be released inside the case. I assume it is not an issue but it's nice to be sure before any smoke is released.
Thanks again for your note on heat dissipation, 73 de Rod.

The classic eTrex Legend is serial, the new 'C' series color units are all
USB I believe. There might also be USB adapters for the older serial units.

OK. Tested the 8" ducky in my aircraft trip out west and it worked great.

Tracked me all the way from South Dakota to north Washington coast - hardly missed a spot at altitude (mostly 10K+ feet) in total 8 hours of flying. The few misses were only when I landed on the ground for fuel. For aircraft owners APRS is a great asset. I even tell the FAA how to track me when filing flight plan.

When doing APRS in aeronautical mobile, please remember to take all the entries out of the "VIA" field. You are so high that you can cover hundreds of square miles direct, and thus you don't need to use "WIDE2-1" (or whatever) to improve your chances of making it to an IGATE.

Communicating with a USB peripheral requires a USB host. Usually that's either a full-fledged computer, or at least a PDA. A USB host is a fairly complex device, responsible for managing all communications on the bus. And then there's the issue of drivers - even if you manage to initialize and enumerate the device, you don't necessarily know how to talk to it. If you're lucky it might conform to a standard for a particular class of devices - a mass storage device, or human interface device, for example - but that's often not the case. You need drivers from the manufacturer to communicate with the device, and those drivers might only be available for certain operating systems.

Take the HP scanner/printer/fax I've got in the office as an example. It's got a USB port on it, and it acts as a USB host, but it only knows how to communicate with devices that implement the PictBridge protocol. An APRS device with a similar host controller would have to have drivers for Garmin, Magellan (actually a mass storage class requiring a complex file system), and any number of incompatible NMEA-over-USB schemes.

Not impossible, but not worth the complexity at this point.

I'm swamped right now, and I'm heading out for a 4-day diving trip. Maybe I'll have a chance to work on it when I get back. Might have to wait until after the initial T2 firmware release, though.

The OT1m finally went on sale yesterday, and that's keeping me busy at the moment. I'm really happy with the new metal case - which is a good thing, because I've got a bunch of them and I'll be using the same case for the T2.

Hello Scott
I note what you are saying, but surely that does not preclude USB? To say that the USB adapter can not be used with APRS gear is a bit broad. Me, I can plug my GPS (with its USB cable) into my computer, and UI-View happily accepts it.
In fact, it seems to me that what you are saying is that the use of USB in peripheral devices meant to be used with GPS is the problem. That it is too hard to include such a host in these devices. Of course devices exist that will do all the conversions required. No doubt such devices are available 'off the shelf' and if not, there are speciality providers who's business it is to provide these. I realise that these facilities come at a price. Nothing is free, I am afraid but is the utility worth the price?
As for saying that a special driver is required for every device/GPS is, I think a bit of a smoke screen. NMEA is a protobol which is fairly universal and these protocols allow the GPS to be used. It is not USB specific. In fact it really has nothing to do with USB at all.

From: scott@opentrac.org
Topic: 3646 Message: 3672

I'm talking about hardware devices, things not using a PC. Obviously if you're on a PC and have the proper driver to make the device show up as a serial port and it's sending NMEA, there's no problem.

But I stand by what I said about device-specific driver requirements. Magellan eXplorist devices show up as a bulk storage device with a FAT file system, and waypoints are read and written from files. Garmin devices accept host commands over a Bulk OUT pipe, and send data through either Interrupt IN or Bulk IN pipes.

Even when you're dealing with straight NMEA piped over USB, it's not as simple as you might think. In RS-232, you've got a single serial data channel and you're simply piping bits in one end and out the other. Not so for USB. You've got potentially many endpoints of several different types, and many different ways in which they can be used. A 'serial' USB device shows up as a serial port on your PC because a driver knows how to talk to that device. If you're lucky, it might adhere to a standard like the USB CDC ACM, in which case your OS probably already has a driver that'll work with it. Implementing that is still way harder to do than RS-232, but at least you know what's going on.

But take the example of the very popular FTDI FT232R chip - it's used in tons of stuff, including the TNC-X and uTNT, and various USB GPS receivers. The designer of the device builds in the chip, and FTDI provides customizable drivers for many operating systems, so the vendor just plugs in their device name and company name and hands out ready-made drivers. Nowhere in the datasheet does it say anything about what communication goes on between the chip and the driver on the host. I'm willing to bet that John, Ioannis, and all of those anonymous GPS receiver engineers have no idea what's actually going over the wire at the USB level when their devices are connected to a host. Generally speaking, they don't need to know and don't care. It only becomes a problem when you've got to communicate with a host for which FTDI doesn't provide drivers.

Confining ourselves to ONLY devices that emulate RS-232 over USB, there are still a ridiculous number of possibilities. Check out the /drivers/usb/serial directory in the Linux kernel source to get an idea of what it takes to support at least a large fraction of known USB to serial adapters.

You state that "Of course devices exist that will do all the conversions required. No doubt such devices are available 'off the shelf'...". Care to provide an example of such a device? Or any existing product that uses one?

If you've already got power to the TinyTrak, assuming it's a TT3 you should be ready to go. If it's an earlier TinyTrak you'll need a null modem adapter.

What did you pay for it, if you don't mind? I sell the GPS 18 LVC with a DB9 connector wired for the TT3 or OpenTracker for $83. That's intended to be powered from the tracker rather than an external adapter, though - newer OpenTracker models and the TT3+ have large regulators to provide 5 volt power to both the tracker and GPS. The Deluo GPS WAAS is way more popular (and $20 cheaper) but the GPS 18 has more features and so far I've never seen one fail.

Connecting the tracker to the radio is another matter - someone else here might be able to help you with the specifics of that radio. But the TinyTrak3 is wired the same as your computer's serial port. If the GPS works on the computer, it should work on the TT3. You might want to check out the TinyTrak Yahoo group for more detailed information.

Subject: [APRS] Garmin OEM18PCDLX ,mouse GPS Pinnout???

hi all

well i have a new Mouse type gps

Garmin OEM18PCDLX,it is a mouse type with a DB9 and a

cigarette lighter adapetr for the 12 vdc.

i need the pinnout of the DB9 to have it cabled at a Tinytrak,is there someone that would have this pinnout???

in the doc i have i didnot find it ,,,,yet!!

thanks for your help

3678. Anyone doing bicycle aprs?

Yahoo group: APRS (1998 — 2006)
Date: 2006-08-14 23:57:44 UTC
From: wolobmp
Topic: 3678 Message: 3678

hello, looking at getting started in a bike aprs statiion. like to know who is using what for equipment, and how well does it all work? i dont want to spend allot of money for this project, but never had any luck with the "tracker" stuff. i had a th-d7a and might have to resort to getting one again, and get a cheapie gps unit and antenna and off i go.
the limited hardware versions of tracker/aprs i just never got to work right at least not for me, i sold mine and havent missed it a bit. so are there any other radio's besides th-d7a ht that have a built in tnc? i run an alinco at home for wx aprs, and that works fine, but little too much for a bike.
thanks in advance for your comments and suggestions....mike

3679. Re: [APRS] Anyone doing bicycle aprs?

I run a th-d7a on my bicycle and feed it from my Garmin GPS-V. I have the th-d7a in a RAM mount. I
am using a rubber duck for an antenna. It does work but could use a better antenna. My son also
uses a th-d7a on his bicycle but he has a 5/8 wave mounted on the carrier behind the seat. I think
it works better. I have three TT-3's in my mobiles and they work great.

>I run a th-d7a on my bicycle and feed it from my Garmin GPS-V. I have the th-d7a in a RAM mount. I
>am using a rubber duck for an antenna. It does work but could use a better antenna. My son also

I'm setting up my son's bike for a tracker, but it only needs to operate within about half a mile of home (which has an Igate and decent antenna) so a stubby duck sticking out of the saddle bag ought to be enough. It'd be rather inadequate for the open road, though.

>I have three TT-3's in my mobiles and they work great.

I have at least 14 OpenTrackers (and T2s) within three feet of my desk, and they work great. =]

>> dont want to spend allot of money for this project, but never had any
>> luck with the "tracker" stuff. i had a th-d7a and might have to resort

Compared to a D7, the only (sometimes) tricky part is the radio/tracker interface. It can be frustrating if you're using something unusual like a Motorola handheld that might require a higher audio drive level and different PTT resistor. Most HTs are easy enough to hook up. You still have to deal with getting power to the tracker and GPS, though. I prefer to use an old HT like an HTX-202, remove the battery pack (the ones you get on eBay are usually shot anyway) and power the whole setup with a NiMH AA pack.

I've never heard of any other HTs with APRS - at least, none that come that way from the factory and have messaging capabilities. Lots of people have put tracker boards inside radios and battery packs.

I run bicycle APRS often around the beach and parks just for the heck of it. The gear is simple, Garmin Etrex Legend cabled to a TH-D7A using a long 2M/440 whip. I set the beacon time to 10 minutes to conserve the battery on the Kenwood for no particular reason but sometimes I am not sure how far I will go. The Garmin runs off 2 AA hi cap Nicad AAs for maybe 20 hours so thats not a problem.

The closest igate is about 6 miles south and there doesn't seem to be a problem hitting it. My home station is listening on the internet with WinAPRS, all for fun and games.

The Garmin and D7 fit into 2 of the side pockets of a handle bar mounted TOPEAK bag making getting in and out pretty easy. Someday I'll mount my FT817 and 40 watt amp in there for HF, maybe this winter.

My backup and original APRS is a package with a tinytrak 3 and Icom 2AT running off a 10 pack of hi cap nicads, also powering the DeLuo GPS Pro receiver. The package is very small and cost $1, its a kids pencil box from Office Depot. I was able to cram everything plus spare parts into this little box. A 42 inch flex whip extends out or I can hang the package from a tree and use a 2 meter TV twin lead J-Pole for maximum distance. This tracker has a relay controlling standby voltage to the Icom so the pack of batteries lasts all day.

All this works very well but I found out the salt air is pretty rough on exposed parts, especially the long antenna as the telescoping sections get gritty and dry. High maintenance is necessary.

Good luck, I've traveled long distances to northern cal and Arizona with these little trackers with excellent success.

Be sure to get a revision G radio. There are a number of good additions to the APRS software in the radio, including the ability to plot other stations on the GPS maps.

For a good 2 meter antenna for a bike try a DDRR. Much easier to swing your leg over the seat than a quarter wave.

Ian

Hi,
I have a Garmin GPSMap 76CS and an Alinco DJ-V5TH.
The handheld stays in a handlebar bag with the antenna coming out,
the GPS goes in a bike mount specifically made for it.
Works well enough here in the Seattle area.

I've done it while out trail riding. I usually have the GPS (a cheapie yellow etrex) and TH-D7 in my backpack. As for the the antenna, I built one of these and it works very well.
http://www.wb8erj.com/bike-ant.htm

If I need a GPS to actually navigate with, I have a Etrex Vista I can mount on the handlebar mount.

Kenwood TH-D7 & Garmin eMap works like a charm on the bicycle.
The eMap does double-duty and usually lives in a mount in the trunk area of my Mini Cooper where it's connected to my TM-D700.

The Alinco DJ-V5 is a handheld unit.
It has dual jacks on top for a mic and speaker.
I use a homemade cable to go from the 3.5 and 2.5 jacks to a DB9 connector.

3692. APRS Messaging

Yahoo group: APRS (1998 — 2006)
Date: 2006-08-22 02:09:17 UTC
From: terranceberscheid
Topic: 3692 Message: 3692

Hi Everyone,

Isn't APRS fun and informative!

But, have you tried messaging anyone via APRS? I have, and only a very few (I'd say less than 5%) of my messages have been acknowledged. Even worse for replies.

As best as I can determine, the messaging only works if
a) the beaconer is still on line;
b) the beaconer is monitoring incoming messages.

I'd like to see a discussion on the messaging features.

Topic: 3692 Message: 3693

The possibility of a centralized message handling service (sort of like the cell networks) has been discussed, but it doesn't seem like a popular idea. Too failure-prone, I guess. I'd like to see the network infrastructure take over responsibility for delivery of packets - it'd reduce the congestion caused by retries - but it'd add complexity.

As far as reliability now, if you're going through an Igate you also have to worry about whether it's configured properly or not to gate message back to RF. I struggled to get my Igate working properly with APRSD and finally had to give up and use Xastir.

A missing ack does not say that the recipient hasn't received the
message. It only says that you haven't received an ack. Acks aren't
re-sent.
>
>As best as I can determine, the messaging only works if
>a) the beaconer is still on line;

Yes (on line, though? On the air!)

>b) the beaconer is monitoring incoming messages.

Who is the "beaconer"? The recipient or the sender? If the recipient,
if he or she has the message client running, the message will stay
there (i.e. until the message client has been shut down)

As APRS was intended as a local, real-time position reporting system,
messages are primarily intended to go on the air to the other user(s).

Try to discuss the item at the TAPR aprssig.

Besides a decent signal and activity, in my experience text messaging depends where you are located not only for access to an igate or the target station but who is managing the APRS network for your area.

At one time text messaging in Southern Cal had good results but APRS traffic has increased to the point of overload and in my opinion, text messages and APRS going in and out of the area have been filtered out. However, from other regions such as central Arizona its possible to text message to San Francisco reliably only if that other station has been beaconing. Its the beacon into the local IGATE that says "I am on this node" so the IGATE system will know how to route traffic to you or from you to your buddy who must be beaconing for the same reason. Its not necessary to beacon every minute, maybe once an hour for a stationary station. RF to RF locally is generally not a problem even if a few retries are necessary.

Local RF to RF has very good results while ACKs to your sent message via IGATE will be frequently lost for any number of reasons including the other fellas RF conditions and his local traffic. For traffic through IGATEs, pull up either findu.com or aprsworld.? and check to see if your message appears either under your call letters or your buddies call letters.

The experience you gain from trying APRS text messaging will eventually help you to understand whats happening in your area and overcome some of the problems.

Good luck, its handy and it does work although with some limitations depending on your location.

If you're sending APRS strings by radio with internet access at the same desk, check www.findU.com for your call sign, and check the Messages box. If an iGate can see it, you're communicating. It may not be good for Contest Points as a QSO, but in an emergency, any method counts.

Not trying to start a war but the original acronym for APRS was Automatic Packet Reporting System and it had nothing to do with Position reports. The GPS function was only added when GPS units became for affordable. Today however I think it's somewhat widely excepted that APRS stands for Automatic Position Reporting System. Today's flavor of APRS has everything to do with GPS and very little to do with it's original intent. The original intent was simply to develop an Ad-Hoc network that somebody with little or no knowledge of the network would be able to use within a 30 to 60 minute window.

I'm not so concerned with what the original intent was then but how do we keep it fun for all without overflowing the bounds of 1200baud. And yes the originators of APRS had no idea that the internet would take such a huge roll in it's development. In larger metropolitan areas I'm sure they are glad the internet was added though. Without it the RF congestion would have doomed APRS to death in those areas a long time ago. Just my 1.5 cents worth. :-D

Dear Amateurs

I just Found some site like :
http://www.infiltec.com/seismo/infkqm10.htm
http://mariottim.interfree.it/doc28_e.htm

I think we can just sent the data generated by device at url#1 using
APRS network.

My question is : Is there any software (preferable Free) that able to:
1. Receive realtime data using APRS.
2. Consolidate/display data coming from many stations and,
3. count/locate the quake location

From url#2, this is a 3-axis sensor .. i think we can put an A/D
converter and feed the result to some form of "packet shooters"

Sincerely
-bino-
Note: Sorry, I'm not an Amateur Radio, so I could not put any
call-sign

3703. APRSWORLD.net server

From: fran miele
Topic: 3703 Message: 3703

I don't know if anyone else has noticed but the geocode links on the APRSWORLD.net site don't work any longer. I contacted the owner and found out that the server that provided that function has died and needs to be replaced. It is going to cost approx. $1200.00 to replace it. If you use that site, like I do, and would like to support the purchase of a new server you can make a donation Via PayPal by going to www.aprsworld.net <http://www.aprsworld.net/> and clicking on the link at the bottom of the page .

I would also suggest that you send the owner an email with your callsign letting him know that you did make a donation. His email is jjeffers@.... That is also his paypal account if you want to donate from your paypal account directly without going to the APRSWORLD.net website.

I hope the moderators don't mind this message but I find it nice to be able to support the hobby when I can.

Fran (N1GAU)

http://eng.usna.navy.mil/~bruninga/aprs.html

Pages got moved (if I recall correctly) from navy.edu to navy.mil. In any case not all search engines etc have changed to the latest version. I just pulled up the .mil version so that should be the correct version. If you have old url's just try changing the extension to the domain name and try them again.

Anyone have an opinion about the best radio to use for a high (1400') digi? Good operation with high signal levels (in band and out of band) is important. 50kW of FM radio station is a few feet away. I'm using a GE Phoenix now, but I would like to move to something newer, more environmentally sealed, and hopefully ham radio based rather than commercial.

Thanks

Ray, good for you. Ours is just fun. Averages 49+mpg. On Prius GPS and APRS, we have avoided the onboard gps because of warrenty issues. So far we use a tinytracker to an external whip, it works fine here. I would be careful about a small linear amp, as the owners manual specifically mentions 2way radio gear as problematic. My HT on 145 or 445 does not affect it even with a rubber ducky. The hybrid seems to like to generate RF garbage and so I'm careful with grounding to the frame. The GPS seems to be the same unit as other Toyotas of the same vintage, so someone with a generic toyota unit might have done this look-see. I will send you more offline.

From what I have read, you can get a 12 volt jump, but you can't give one. You can help charge the other guy's battery, but you have to disconnect before he hits the starter. The current draw of his starter is more than our system can take.

How about connecting ham radios? I hope I can get a better connection than the cig jack.

Any pointers on antenna installation? Thanks.

If you haven't done it lately, google around for info on mods for the Prius. It's like the ham radio of the automotive world. I can't wait.

NMO mount on a bracket coming out of the hatchback lid. Standard stuff 2 meter whip. NO amp, just the pockettracker bnc to the whip. Works wonderfully. But then, we have 9,000 ft sites for the recievers. The cig connector is a cheapie, wire around it for reliability. Did U get my email?

3717. RE: [APRS] Best Digi radio

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-04 18:12:02 UTC
From: Richard Sharp, KQ4KX
Topic: 3711 Message: 3717

Ray,

As for "Amateur" gear I've been quite impressed with Kenwood's TM-271. It has a reasonably well sealed chassis (the top lid has a gasket) and has a large heatsink. I've found the protruded aluminum body where the mounting bracket secures to the chassis is a nice place to ground the unit too. Unfortunately, the USA version of this radio doesn't include the "data jack" which on this radio is a pigtail with a DB9 connector. However, on the main circuit board the solder pads are clearly marked as outlined in the manual for the "data jack" for other markets. You simply route your cable out the same port the OEM cable would (the USA version has a foam insert). The other method of connection to the TNC would be via the front panel RJ connector. However, the 271 doesn't include receive audio on any of the pins. So, I used a small Teflon wire (28AWG) and soldered it to RX audio pad on the circuit board and an unused pin on the RJ connector. Then the front panel RJ has GND, RX, TX, PTT, & even 8VDC to power the TNC.

As for strong FM signals I know of at least two installations that are on broadcast towers and the TM-271 radios do just fine. These two sites also utilize either a bandpass filter or a DCI filter. The DCI filters are going to be a bit more broad (2m band) than a single cavity bandpass filter. I use single bandpass filters on my sites just as a precaution.

Another radio worth considering is the ICOM IC-V8000. It has no provision for an external "data jack" but all connections can be had from the front panel RJ connector including powering the TNC. It is also a solidly built radio.

I haven't even looked at any of Yaesu single band radios lately so can't say good or bad about them.

Richard

Anyone have an opinion about the best radio to use for a high (1400') digi? Good operation with high signal levels (in band and out of band) is important. 50kW of FM radio station is a few feet away. I'm using a GE Phoenix now, but I would like to move to something newer, more environmentally sealed, and hopefully ham radio based rather than commercial.

Thanks

I did a quick writeup of this on my website.. it's at http://n1vg.net under 'TM-271A Mods'. Somewhere I've got a ton of mini-DIN pigtails that came from Deluo GPS receivers I modified. If they're long enough, they'd probably make perfect data connectors.

hi

well maybe i am not at the right place for my quuestion but i am guessing,,

i am running a digi on a remote mountain,i must stop it retransmetting data ,

it is a kpc3 with the 8.2 firmware,is there a way to stop it?

in my packet node in TheNet we can send the command Closedown as Sysop to stop it and it need an human intervention to retart it,is there something in that manner in the digi??

i can access it remotely at the moment but i cannot go there before the end of the week

any help will be greatly appreciated

thanks

Hi

I am a graduate engineering student at Southern Illinois University-Edwardsville. I am looking for a way to record the speed of an automobile and write it to a text file. I need a sampling rate of at least one per second but 2/second would be better. I want to end up with a spreadsheet that looks something like this:

```
time | mph
--------------
0.5 | 1.1
1.0 | 1.8
2.0 | 2.4
2.5 | 3.2
etc
etc
```

I have access to a Magellan Meridian Gold and a Delorme LT-20. I need this data to complete my research project so any advice would be greatly appreciated.

Thank you

Topic: 3721 Message: 3722

Are you trying to record it locally, or from a remote monitoring station? Embedded or computer-based?

1 fix/second is doable with many (most?) consumer GPS receivers. More than that gets expensive. I sell the Garmin GPS 18 for $78 and it does 1/sec - the version that does 5 samples per second retails for about twice that. And it's only in Garmin's proprietary format, not NMEA.

You could also probably get speed data from the car's OBD II port. There are lots of data loggers out there for that. This one might not have enough memory, but it's an example...

http://www.davisnet.com/drive/products/drive_product.asp?pnum=08221

There are also plenty of commercial NMEA loggers. The really simple way to do it would be to hook the GPS up to a laptop, log the NMEA data, and then use a simple script to extract only the time and speed (in knots).

The first challenge is to connect a laptop to the GPS, connect to it
with Hyperterminal and see data received on the laptop screen. Parts of
this challenge:

o get the right connectors for both ends of the cable

o connect the grounds together, and data out from the GPS to data in
of the computer.

o configure the GPS to send NEMA data

o configure the Hyperterminal com port settings to match the output
of the GPS. Baud rate, bits, parity and stop bits must match what the
GPS puts out.. WAG: 4800,8,none,1. Flow Control must be None.)

Next, capture the text using Transfer/Capture Text in Hyperterminal.
What you get is a file with a GPS fix per second in each line. You may
be able to save your self some data reduction time with the right GPS
configuration.

Finally load the captured data file into Excel as a CSV file and chop
out the columns you don't need. The fun part will be correlating the
GPS time stamps with events in your experiment.

As Scott mentioned, if one record per second isn't good enough most
inexpensive GPS's won't do the job.
```

I don't know your model, but my Garmin GPS receiver outputs a text string more than once a minute. All you would have to do would be to capture it to a text file.

Check the manual for your unit. Do you have the interface cables to connect it to a computer? If so, it should just be a matter of connecting it to a computer and using hyperterm or some other terminal software to capture the data it spits out. You may be able to select its output sample rate.

Any marine GPS receiver will work. You just need a unit that spits out the string, not a flashy display and all.

Pretty simple. Just give the GPS unit 5V (or 12V for mine) and it will spit out data forever. You can't shut it up!

In fact, the small USB GPS units you can get at Staples with mapping software may do the exact same thing.

Thanks. Looks easy. Could you add the pinout? I'm not clear on what each pad is from the silkscreened names.

Any downside to going right to a cable with a DB-9 to connect to the KPC-3+? I think I could go from +12VDC in the radio (through a fuse) to pin 7 of the DB-9 and even power the TNC via the radio. Any suggestions on the best place to pick up the 12VDC from that side of the board?

Thanks for documenting your work on the web.

Hi,
I'm presently running a Deluo GPS and a TT3. I would like to know if a Kenwood TM-D700A will do the same thing as the TT3 using just the D700A and the GPS unit? Also how compatible is UIVIEW with the D700A.....Kerry - WA2NAN

The D700 won't do SmartBeaconing. IMHO, if you've already spent the money on a D700, you might as well use a GPS receiver with a map display so you can see other APRS users.

UI-View has a ready-for-use comand file for use with TM-D700 in TNC
mode. Some users have reported that the built-in TNC might have
trouble with UI-View in _KISS_ mode (e.g. in order to use the setup as
a UI-view digipeater; it mightn't manage the amount of data) But if
you set the communication sith host mode=NONE and select the TM-D700
cmd file, you'll be all right.
It takes some editing, as the cmd files are written in UK and hence is
using the frequency 144.800 rather than the frequency you are using
for APRS in USA (144.390). In the UI-View yahoo group's file area
somebody has placed a ready edited cmd file.

3733. RE: [APRS] Re: Best Digi radio

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-09 21:47:08 UTC
From: Richard Sharp, KQ4KX
Topic: 3711 Message: 3733

Ray,

Each silkscreened name is described in the user's manual of the TM-271 in the "packet data" section.

A single multiconductor cable between the radio and KPC3+ would be just the thing to do for a digi site - keeping it clean and neat.

Acquiring power from inside the radio shouldn't be a problem - the main 12VDC lead-in is adjacent to the "data" solder pads. Using a "Littlefuse" or equivalent would probably be a good idea inside the 271's chassis.

Richard

-----Original Message-----
From: APRS@yahoogroups.com [mailto:APRS@yahoogroups.com] On Behalf Of Ray_Vaughan_99

Thanks. Looks easy. Could you add the pinout? I'm not clear on what each pad is from the silkscreened names.

Any downside to going right to a cable with a DB-9 to connect to the KPC-3+? I think I could go from +12VDC in the radio (through a fuse) to pin 7 of the DB-9 and even power the TNC via the radio. Any suggestions on the best place to pick up the 12VDC from that side of the board?

Thanks for documenting your work on the web.

Ray, KD4BBM

Set "EMAIL" as destination address. In the message body, write the
recipient's email address, then a space, then the text you wish to
send. It's a good thing if the recipient's email address is short :-)

From: Armour, Randy (ITS)
Topic: 3734 Message: 3736

cut from a message on the AmSat bulletin board....

I have sent messages via ISS with a Kenwood D7, as well as the 144.39 network. It is important that the message format is:

EMAIL <<all caps followed by one space>> then the email address, another space and a short meassage of less than 46 characters.

Hope this helps,

Randy - KI4LMR

Or, if you REALLY WANT to have fun, send an APRS message in this format:

:EMAIL :wb4apr@... Hi via Ham radio and the ISS, etc...
or
:EMAIL :abcde@... Text begins here using one line only.

This APRS message (if received by any IGate station, anywhere) will be captured by the APRS system, converted to an EMAIL (by the WU2Z server in New Jersey) and EMAILed to the EMAIL address in the message. Note, a valid EMAIL address must be the first WORD of the message... and all the message must fit on one line...
The word EMAIL must be in upper case (capital letters).

If you watch your terminal screen, you _may_ see the automatic acknowledgement packet from WU2Z go by (something like):

WU2Z>APM352,TCPIP*,qAC,WU2Z::WB4APR :EMail message delivered OK{100

Of course the easier way to format these messages is by using APRS software instead of only a terminal program.
Good luck!

Greetings
I have a bit of a problem. I have an Opentracker set up in my car with GPS. What I am trying to do is monitor its sending using my Base station running UI-View. My station will not show the signal from the O/T on the terminal screen at all. I know that it is getting out because I can see the response when it is digipeated from our local digi. But no direct response at all. UI-view is using AGWPE and I can monitor the audio which looks OK when the O/T beacons. Does anypne have any idea what could be causing this? tia

Make sure you're not overdeviating. If you've got the audio level cranked up too high on the OpenTracker, it'll distort the tones and make it hard to decode. The OT1m and OT1x with the 'HI' jumper set both have a pretty high audio level by default (for compatibility with commercial mobiles, mostly) and you'll need to turn it down for many radios.

Also check your TX delay setting. Could be that it's too short, and the squelch on your (receive) radio is eating the first part of the packet. Most digis run open squelch (and most home stations don't) so your station likely requires a few milliseconds more to lock on than the digi does.

Its via RF. Yes I can receive other stations via RF or Igate thru agwpe. I was worried about RF 'swamping' and have played around with power levels and audio levels with no result. System seems fairly immune to changing levels. Just no decode of the OT.

Have you looked at the UI-View terminal window vs the monitor window? The terminal window should show all packets received from agwpe the monitor window only shows those that UI-View understands.

Have you tried running the OT transmitter into a dummy load to see if it might be a receiver overload problem.

It look like other stations are picking up the OT okay. Does the OT have an adjustable TX delay? Maybe a little more time would give your receiver a chance to settle down before the data comes.

Well Scott, you were quite right. Turned out to be over-deviation. Noticed that the spectrum lines from the OT on the spectrum analyser of AGWPE were way outside the two lines provided. Turned back the audio going to the Tx and voila. Good copy. Very touchy adjustment. Has to be just right.
Thanks for your advice.

3748. RE: [APRS] Re: Not seeing data on APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-16 16:28:08 UTC
From: scott@opentrac.org
Topic: 3738 Message: 3748

The newer OT1m kits have a wider audio output range, which can make it a bit touchy. You can turn it down in the config program as well. The OT1x has a selectable high or low range, but even in the low range the proper adjustment range is pretty narrow for some radios.

Graeme zl1gbb
Well Scott, you were quite right. Turned out to be over-deviation. Noticed that the spectrum lines from the OT on the spectrum analyser of AGWPE were way outside the two lines provided. Turned back the audio going to the Tx and voila. Good copy. Very touchy adjustment. Has to be just right.
Thanks for your advice.

Graeme zl1gbb

3749. APRS Digi

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-17 19:29:21 UTC
From: Bob Gould
Topic: 960 Message: 3749

I am looking to set up a temporary digi for an event that needs extra coverage. Can a KPC3 Ver 6.2 or an MFJ 1270C be used as stand alone units without having to run a computer with them. I have setup to try my KPC but have not seen any data that looks like it was passed by it. Any help would be greatly appreciated.

Thanks
Bob

Hi Bob. You'l need a computer to set up the KPC-3 but then you can run stand alone without one. Are you sure you meant Ver 6.2? Anyway, check out the following for the info you are seeking: http://www.kj7az.com:8080/digidocs.htm

While it is true that you can run a KPC3 stand alone without a computer for APRS
I don't think you can do it with Ver 6.2.

3752. APRS TNC Options?

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-23 11:40:56 UTC
From: kf8zn
Topic: 3752 Message: 3752

I have an old Motorola "beater" that I wish to press into APRS Service.

What are the "barebones" options for TNC's for APRS, new/used ??

I will be using a Trimble Crosscheck GPS and Tiny Tracker.

KF8ZN

3753. New user and having trouble

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-23 15:40:38 UTC
From: kf4ofi
Topic: 3753 Message: 3753

Hello everyone. New to APRS and having some trouble. I can hear the local APRS Digi and Winaprs is receiving the data and seems to be working. But I dont seem to be transmitting data correctly. I can send my position and the digi doesnt repeat it, so I am never making an I gate. What settings should I check or what should I do. I am using a buxcom rascal and agwpe on win 98. I can hear my station transmitting data on my ht, but I feel like the digi isnt understanding what is being sent. Any ideas?

Thanks
Curt

3754. KAM PLUS Ver 8.2

From: Stan - N0YXV
Topic: 3754 Message: 3755

If I recall correctly 9.3 is the latest version and it contains some "fixes" to how it checks for duplicate packets. So 8.2 would work but could add some unneeded QRM.

Any TNC will work if you connect the TNC to a computer and run them both anytime you want to use it. If you turn off the computer it would cease to be an APRS station. The new Kantronics (KAM / KPC3+) have APRS built in. If your going to use it as a tracker in a car you might want to take a look at http://www.byonics.com/tinytrak/.

Hi,

Something similar happened to me using AGWPE. I found out i had to
increase the TXDelay value so that the APRS packet could be well
understood by the digi. I had to change from 25 to 50 the value. You
could try that.

3763. RE: [APRS] Sending message via APRS to internet email address

Yahoo group: APRS (1998 — 2006)
Date: 2006-09-12 06:40:44 UTC
From: Armour, Randy (ITS)
Topic: 3734 Message: 3763

I have only the D7, not a D-700. So, I can't answer this question with 100% confidence. The D7 also has an address line (for the call sign), and a separate line for input of the APRS message text. On the D7 (and probably D700 also), place the word EMAIL as the call sign. The first character of the message text must be the beginning of a valid email address. A space must separate the email address from the actual message.

I sent myself a test message to validate the paragraph above. You can verify that your message made it to an I-gate by a search on findu.com. See example at
http://www.findu.com/cgi-bin/msg.cgi?call=ki4lmr-3

The reply (in link above) from WU2Z indicates the message was delivered to my Internet email address.

You can also verify messages as they pass through APRS-IS. See example at:
http://www.db0anf.de/hamweb/aprsdb/showdata/WU2Z/shmessages

If your callsign is found in the to/from fields, it will link back to the same information found in the first link.

Not sure I'm doing it right.
Setup:
Laptop with UI-View
TNC-X
Radio receiving 144.39. TX side to radio not connected at this time.
See stations/hear stations.

On Ui-View, click on Messages, in To field, I put APRSDEPOT
In Text field, I put my call, that is C W6RWN-9, just as a test. Can
I do this? I send it, and upper screens says so, but never see
anything from APRSDEPOT indicating anything about IRLP Nodes. My
node is right here at this QTH. Maybe I have to send this APRSDEPOT
call through on to the radio, and go out RF instead through the
network? I pretty much a newbie, so bear with me.

I think you are right! I use UI-View, TNC-X, and radio (RX only at
this time. See good APRS trafic. Followed instructions by putting
APRSDEPOT if To field, and C W6RWN-9 in Text field and send it.
Don't see any reference to IRLP come back.

I think we're doing the same thing. Putting APRSDEPOT in the TO box
and the letter C plus the call in the Test box, like C W6ABC-1
(example)
It looks like it connects, but don't see any IRLP reference. Oh
Well, someone tell us off, or maybe there is trouble!

Hi Fran;

Your call sign is not showing up in any of the logs. We probably shouldn't clog up this list with this, but if you want to post your problem on the boards we can troubleshoot together.

Subject: RE: [APRS] AVRS Launched Yesterday

We had a process stall late last night... It's been restarted and the code is being authored now that will check and reset trapped processes in the AVRS system and the code is being worked over to find the stall culprit... All better now...

Subject: [APRS] AVRS Launched Yesterday

For those that may be interested, APRS Depot launched AVRS yesterday. The Automatic Voice Relay Service (AVRS) is a concept first outlined by Bob Bruninga over 6 years ago. Working with Bob over the last two week we managed to get the software online and the first release is ready.

For details on the service and more information on AVRS in general, please feel free to visit:

Well, I found one issue in my code but I don't suspect it relates to the issues you and Fran are having...

To date over 1000 successful transmissions have been handled. However, I did find a few suspect issues in which random messages were not acking as they should. This (I suspect) was how the system generated the message line (the ack essentially). I have corrected that portion.

However, you and Fran are stating that you can't get ANY response. This is odd, but I would encourage you two to try it again with this re-write and let's see how it goes...

I see you got AVRS to work. How did you set it up in Messages in UI-
View? I still can't get it to work for me. I don't have the transmit
to the radio connected yet, but just receiving APRS data from the
radio. I figure my send would be sent into to computer and into
network. Maybe I'm wrong.
I put APRSDEPOT in the TO field and C W6RWN-9 in the Text field and
sent it. I get in STATUS field, 01, 02 03, 04, 05, 36N, which
indicates it failed. I even tried setup with a live station I see,
W6KOZ. See same Status numbers and then failure.

Fran
I must have some other option or setup wrong, for AVRS still doesn't
work, even with "I" in Port
Actually, I've only used UI-VIEW to receive on the TNC-X, which it
does fine. I know the tnc transmits, but only heard on another radio
on same fequency. Never got indication anyone received my message
when I tried a few times. Wonder if you could indicate your APRS
Server Setup? In Comms setup, Host mode is KISS. Kind of getting
tired of trying this or that, almost lost interest. But, if you can
shed a bit more light on this newbie, that would be FB.

3788. Lowrance LMS-480m with NMEA 0183

Yahoo group: APRS (1998 — 2006)
Date: 2006-10-13 14:09:10 UTC
From: n4baf
Topic: 3788 Message: 3788

I have a Lowrance LMS-480m sonar/gps combo with 5" diagonal 480x480 pixel diplay. I used it when I had my bass boat. It has built in GPS. I noticed today that it has a RS 232 Comm and when I looked over the manual; I saw it has NMEA 0183 cable connections. It has yellow wire to trannsit and orange wire to receive and shield to ground. Does any one know if I can use this with APRS. I would be nice to get the data to the LMS-480 display and use it like a tracker or fixed APRS station. I don't much about NMEA, but I'm familiar with the standard APRS/TNC connection.

Probably. You need to know what sentences it puts out - in particular, you want at least one of GPRMC, GPGGA, or GPGLL. You can always try hooking it up to a PC, and watch the NMEA stream at 4800 baud.

I have it. Using rig for IRLP node. Schematic is quite large on front
page and back page (1 sheet) Is there a part you need? not sure if it
wil scan real well, but could try. I see ebay or other sources have
they for about $18.

From: APRS@yahoogroups.com on behalf of Armour, Randy (ITS)
Sent: Tue 9/12/2006 1:40 AM
To: APRS@yahoogroups.com
Subject: RE: [APRS] Sending message via APRS to internet email address

I have only the D7, not a D-700. So, I can't answer this question with 100% confidence. The D7 also has an address line (for the call sign), and a separate line for input of the APRS message text. On the D7 (and probably D700 also), place the word EMAIL as the call sign. The first character of the message text must be the beginning of a valid email address. A space must separate the email address from the actual message.

I sent myself a test message to validate the paragraph above. You can verify that your message made it to an I-gate by a search on findu.com. See example at
http://www.findu.com/cgi-bin/msg.cgi?call=ki4lmr-3
<http://www.findu.com/cgi-bin/msg.cgi?call=ki4lmr-3>

The reply (in link above) from WU2Z indicates the message was delivered to my Internet email address.

You can also verify messages as they pass through APRS-IS. See example at:
http://www.db0anf.de/hamweb/aprsdb/showdata/WU2Z/shmessages
<http://www.db0anf.de/hamweb/aprsdb/showdata/WU2Z/shmessages>

If your callsign is found in the to/from fields, it will link back to the same information found in the first link.

Andy,

Last I read was that when the crew was testing the SSTV software there was some failure, the failure also caused the digipeater or APRS software to fail? The SAREX group is working on a solution. As the other message advised, monitor the ISS fan club site and maybe subscribe to the AMSAT-SAREX, AMSAT-BB mailing lists:
http://www.amsat.org/amsat-new/tools/maillist/

I read that some are doing APRS on AO-51:
http://www.amsat.org/amsat-new/satellites/status.php

And Packet is being transmitted on CO-55 (Cute 1):
http://www.amsat.org/amsat-new/satellites/status.php

From: Kelly Boswell
Topic: 3802 Message: 3802

Hello all;

When operating aprs through the ariss, do we still include the word "Wide" in the path? It's been a couple of years since I used it. And since then, the new n-N paradigm has come to forth.

In short, what *is* the "Path" for APRS on the ISS, nowadays?

Thanks,
Kelly, KA5MGL

Kelly,

The Path to ISS can be:
UNPROTO ARISS or RS0ISS-4
In your "Digi" you can place WIDE, SGATE.
See how some others are sending APRS messages:
http://www.findu.com/cgi-bin/ariss/index.cgi
Page down to under the "chart" and Recent Activity

Still no posts about when ISS will be back on APRS or SSTV.

HTH,

Jerry - K0HZI

Date: 2006-10-19 17:22:07 UTC
From: Tom Bailey
Topic: 3805 Message: 3805

I just can't even believe how far APRS has come along in my eight year absense. To make a long story short, I used a Kenwood TM-261a with Kantronics KPC 3+ back in the day and QRTed my station due to lack of activity (even though I did get to work Bob Bruninga while he mobiled through upstate SC years ago) oh, and I was running some ancient version of APRS dos on an old 486DX2. Well, the 3+ was loaned out to a freeloader ham (AF4EE)and I never got it back. So, here I am now at square one with a Yaesu FT-8100r, a MFJ 1270c (with no software or cables, but I did download the 264(!) page manual). So, as I am absolutely clueless of where to go from here, I suppose I will start reading through the archives of threads here and elsewhere to see if it is even possible to address this ancient TNC with no software available that I can find anywhere for it and make it all run while using Windows XP Pro.

The NY City telephone directory of a manual for the 1270c would appear to be useless for current day use with the exception of identifying pin-out on the TNC, so, in the odd event that someone might have one still in use, is using a FT-8100r or current day Yaesu rig with the same pin-out, any hints as to how I can address the TNC (or let me know if it is even necessary to do so, ie., does the fancy new WinAPRS take care of all modem addressing issues for me ..) and make it all come together running WinXP Pro, and you have nothing better to do with your time. Please help point me in the right direction either here, or by emailing me directly at ku4my@charter(NOSPAM).net (obviously omit the canned meat reference in the email address).

Will be looking forward to hearing from you all and following (or trying to) all of the new and exciting APRS stuff here. Who knows, I may even get lucky and get back on the air!

Thanks and very 73 de Tom ~ KU4MY

There are a couple of ways to do it, one of which takes a while and requires you to do multiple steps, but gets you the latest version. The other method is much more automatic and faster to install but gets you an earlier release of Xastir.

There are quite a few people running Xastir on Windows. I'd suggest subscribing to the mailing list at www.xastir.org and asking questions there. The Windows users would be happy to help you with any problems you might come across.

I'm not a Windows user but I wrote the manual install instructions for Window way back when. I _might_ be able to help here and there too.

From: Jim
Topic: 3804 Message: 3807

I'm looking for alternative iGate software.

My first venture into this area has been with UI-View and, whilst being good when it's connected, is poor at recovering from internet link dropouts.

My application is for an unattended station, so I'm looking for something that is robust and reliable.

Map display is not needed, just something that will push packets between the Internet and RF based on the usual iGate rules.

I'm not a Linux person, so must be something that is Windows based.

Can anyone make any recommendations?

Thanks.

Jim

Yea, it has.

Check out the APRS Client Capabilities Chart, one of the links on
the left at my homepage listed below, to get an idea of the
capabilities of most of the APRS clients.

I'd probably recommend UI-View for Windows as it is the easiest to
set up and use.

For Linux/Unix/MacOSX I'd recommend Xastir, but some would say I'm
biased.

I suppose the main question is, what do you want to DO with APRS? If you want to track your own vehicle, an MFJ2170C is definitely not the best solution. If you want to use an old TNC, just run it in KISS mode and use it with WinAPRS, AGWTracker, or whatever. Or download one of those programs and skip the radio side altogether - get your data from the Internet until you decide what you want to do.

Hi Curt and Scott and thanks for the replies. Very sorry I did not make my intentions clear, but I was intending on setting this first reentry up for my base APRS station. As there are a few fine choices for mobile and portable APRS set ups, ie., built in TNCs, etc. I was just going to get back on the air and find out what and all is available before spending my life savings on a 'bunch-o-stuff'.

I will check out what you had suggested Scott, it sounds like either a monitoring set up or an APRS version of Echolink or something to me, if so, I will not be interested in that beyond satisfying one evenings curiosity, I'm sure. I was quite shocked when I saw that the registration fee for WinAPRS was $60, to say the least, so I will be checking out the suggested alternatives as I was very unimpressed with WinAPRS's features for the price, or more accurately, the lack there of.

Thanks and hope to work you on the bands, 73 de Tom ~ KU4MY

Jim,
Check the 'Enable auto reconnect' box in the 'APRS Server Setup' menu
in UI-View. UI-View will try to reconnect automatically every couple
of minutes.

<snip>

This is absolutely incorrect. I have watched UI-View continue to try and
connect to an IS server every 30 seconds for over 2 hours during an internet
outage. (OK, I didn't sit and watch it the whole time, but it was still
trying 2 hours later when the internet connection was restored and it then
re-connected immediately).

It all depends on what choices you make in the setup screens. Take the time
to read the built-in help screens in UI-View. It's all there.....

Welcome to APRS. It's a fun part of ham radio. If you take a look at the following page, it'll give you a list of all the stations near your zip code:
http://www.findu.com/cgi-bin/near.cgi?zip=38965&last=240&distance=200&n=50&rate=1

Unfortunately, there are no stations near Water Valley. The closest ones are up in Tate County, east of Senatobia. If you have a high enough antenna (a beam would be helpful in your case), and enough power, and depending on your terrain, it's possible you might be able to make it into the digipeater up there. I used to live near there, but I don't remember the usual range for a station in your area. Keep in mind that APRS transmissions have a much shorter range than voice transmissions. In APRS (like normal packet radio), the receiver needs to receive a strong signal in order to properly decode it. If there's even just a little static in signal, it won't be able to decode it.

As for the equipment, it kind of depends on what you want to transmit. In most cases, you'll need a GPS unit, like if you want to transmit your position as you drive around town or take a trip. But if you just want to transmit the location of your house, you can get by without a GPS. Then you'll need something to generate the APRS packet. This can be anything from a TinyTrak module ($40) to a Kenwood TM-D700 transceiver with built-in TNC ($500), or in between with a standard TNC ($100 to $300). A good place to start is the APRS-Wiki. (http://info.aprs.net/wikka.php?wakka=APRS
) There you'll find some helpful information, and under the Hardware link, there's a good list of popular equipment and links to their web sites. Each one has its pros and cons, so it really depends on what your goal is, and how much you have to spend. I've got 3 D-700's, 4 TinyTraks, 1 OpenTracker, 2 TNCs, and use 3 different APRS software packages, so ask if you've got questions.

Even if there aren't any other stations in your area, you can still operate by yourself. I've lived in several remote locations where no one else could receive my signals, but I had an APRS station at my house, and one in my car. That way, my wife could sit at the computer and watch me drive around town. And once you start operating APRS and you tell your ham friends, perhaps they'll see how much fun and useful it is, and they'll join in. Someone always has to be the first one in a new area. Plus, you can always connect your APRS software to the internet and receive the stream of live APRS data from the entire world. If you've got more questions, you can ask them here on the group, or I'll be happy to answer them if you email me directly, off list.

73,
Andy

Jan,

Looks like there is not much very near. Take a look at
<http://www.findu.com/cgi-bin/near.cgi?lat=34.148&lon=-89.638> and you will see the activity in the
last 240 hours centered near you.

Depends on what you want to do. If you want to get a PC on the air, you can't get any cheaper than a software-based modem like soundmodem (for Linux) or AGWPE (for Windows) and a plain old sound card. I run a receive-only setup on a laptop with just a scanner and 1/8" mono patch cable.

For a transmit-only tracker, I'm partial to the OpenTracker, but I'm a little biased since I designed it and everything. =]

From: Mike Morris WA6ILQ
Topic: 3813 Message: 3821

Give the signal every advantage you can:

a) pick a quiet channel. Your SAR team does NOT need to be on
the national channel. You don't need to see where every Joe Ham is,
and they don't need to see where your folks are.

b) get the base station antenna up as high as possible. I've seen a
30' pushup mounted to a piece of 2x8, and that block of wood under
the rear tire of a station wagon, and the pole tied to the luggage rack
as well as guyed. Use a gain antenna - that compresses the pattern
vertically.

c) run enough power on your team members to get a DFQ signal back
to the base - remember that if you drop one bit in a packet, it's like you
didn't hear the packet at all. As WA8LMF is find of saying, the packet
range is generally 1/3 of the voice range, and that's with antennas in the
clear. Too many folks run the HTs on their hips, and body absorption
kills the signal.

d) Make sure that the radios on both ends are set up properly. Again,
give the signal every advantage you can. I've seen packet deviation
everywhere from 9khz to 300hz, and folks wonder why the receiving
end doesn't decode.

In short, the setup and adjustments of the SAR team tracking radios
and the associated base station are a lot more important than the
exact type of radio. If you set things up so that the only user
adjustable controls is an on-off switch and a way to change batteries
it will be a LOT more reliable.

I'm assuming you're talking about man-portable trackers and not vehicles. Are you planning to run the trackers on your voice channel in mic encoder mode, or use dedicated data radios?

I've run a custom OpenTracker setup with a Motorola GP68 handheld and Deluo Universal GPS in a CMC Rescue comm harness - the GPS receiver fits perfectly under the elastic band on the shoulder strap and the tracker fits in the upper pocket of the harness, next to the radio. The setup still needs work, though, and it can be difficult to get good data with a 5-watt handheld with the antenna against your chest.

My backpacking setup definitely works better - I've used a dedicated radio with an 8-pack of AA batteries in the top compartment of my pack, and a 1/4 wave vertical attached to the pack frame.

By the end of the year I'll be testing a configuration that might be a good option for SAR field use. I've got samples on the way of a compact 6-watt sythesized VHF transceiver that's usable (and legal) from 136 to 162 MHz. I've got to see if I can find a good waterproof enclosure to hold the transceiver, tracker, and battery pack.

It'll be mated with a Tracker2 board, which is good news for SAR. The T2 does digipeating, so field teams can relay for each other if necessary, and it'll also output waypoints to your handheld GPS receiver. That means you can see where the other field teams are at, and the command post can send objects (with attached notes, if supported by the GPS) that'll show up on your map - search assignments, rendezvous points, or whatever.

I'm guessing that the cost for a finished unit will be in the $350 range, with most of that being the cost of the transceiver. Puts it out of the range of a lot of casual users, but I suppose it's in the same ballpark as a TH-D7A, which doesn't have nearly as much APRS smarts.

Or set up each team to be a WIDEn-N digi for every other team. Not that higher power (5W-7W) isn't a good idea anyway for the field teams!

> d) Make sure that the radios on both ends are set up properly. Again,
> give the signal every advantage you can. I've seen packet deviation

Proper deviation is in the neighborhood of 3 kHz. Most signals you'll hear on the air will be overdeviated, so if all you can do it set it by ear (no deviation meter), set yours to be slightly quieter than others on the channel.

3826. DIGI setup WIDE and WIDEn-N

Yahoo group: APRS (1998 — 2006)
Date: 2006-10-24 21:41:33 UTC
From: Eric
Topic: 3826 Message: 3826

I'm in the process of setting up a wide area digi and I've ran into a problem. I have a KPC-3 with the 9.0 firmware and programmed it up to the specs of http://web.usna.navy.mil/~bruninga/aprs/kpc3+WIDEn.txt.

The problem is if a user has the old path of RELAY,WIDE my digi will not repeat the packet it will only repeat if the user has a WIDEn-N path.

Allot of hams in my area are still running the RELAY,WIDE path so their packets are not being digi'ed when they are in my coverage zone.

So now the question. How do I get my KPC to repeater packets with the old path ? Is there a command I missed or config wrong ? Any ideas or suggestions would be great

No, you're not missing anything. You should set the digi up per the correct specs so it does NOT digi on RELAY or WIDE or TRACE.

This is not exactly a new change (what, 2 years now?) and the users have had plenty of time to make the switch. If they insist on running an old outdated path, they don't get digi'd. Simple.

Kind of like insisting on using an old area code that has been changed. You can dial it if you want to, but you're not going to get anywhere.

I have my iGate set so it won't even gate anyone to the internet if they have RELAY or TRACE in their path.

I agree with Ron. It's time to cut away from supporting RELAY and TRACE. I too have stopped iGating those two. I can't believe how many digi's are still supporting the old paradigm. I was checking digi's between Connecticut, where I live, and Texas so I could figure out what to set in my sons TT3. He is leaving for Texas on Saturday. I found most are still using RELAY. I'll tell ya, if you come to Connecticut with relay in your path you won't get digi'd by any of our repeaters.

When is everyone going to change!! Let's get with the program!

Subject: Re: [APRS] New to APRS and looking for any APRS station near water valley, Mississippi

Give the signal every advantage you can:

a) pick a quiet channel. Your SAR team does NOT need to be on
the national channel. You don't need to see where every Joe Ham is,
and they don't need to see where your folks are.

b) get the base station antenna up as high as possible. I've seen a
30' pushup mounted to a piece of 2x8, and that block of wood under
the rear tire of a station wagon, and the pole tied to the luggage rack
as well as guyed. Use a gain antenna - that compresses the pattern
vertically.

c) run enough power on your team members to get a DFQ signal back
to the base - remember that if you drop one bit in a packet, it's like you
didn't hear the packet at all. As WA8LMF is find of saying, the packet
range is generally 1/3 of the voice range, and that's with antennas in the
clear. Too many folks run the HTs on their hips, and body absorption
kills the signal.

d) Make sure that the radios on both ends are set up properly. Again,
give the signal every advantage you can. I've seen packet deviation
everywhere from 9khz to 300hz, and folks wonder why the receiving
end doesn't decode.

In short, the setup and adjustments of the SAR team tracking radios
and the associated base station are a lot more important than the
exact type of radio. If you set things up so that the only user
adjustable controls is an on-off switch and a way to change batteries
it will be a LOT more reliable.

Subject: RE: [APRS] New to APRS and looking for any APRS station near water valley, Mississippi

I'm assuming you're talking about man-portable trackers and not vehicles. Are you planning to run the trackers on your voice channel in mic encoder mode, or use dedicated data radios?

I've run a custom OpenTracker setup with a Motorola GP68 handheld and Deluo Universal GPS in a CMC Rescue comm harness - the GPS receiver fits perfectly under the elastic band on the shoulder strap and the tracker fits in the upper pocket of the harness, next to the radio. The setup still needs work, though, and it can be difficult to get good data with a 5-watt handheld with the antenna against your chest.

My backpacking setup definitely works better - I've used a dedicated radio with an 8-pack of AA batteries in the top compartment of my pack, and a 1/4 wave vertical attached to the pack frame.

By the end of the year I'll be testing a configuration that might be a good option for SAR field use. I've got samples on the way of a compact 6-watt sythesized VHF transceiver that's usable (and legal) from 136 to 162 MHz. I've got to see if I can find a good waterproof enclosure to hold the transceiver, tracker, and battery pack.

It'll be mated with a Tracker2 board, which is good news for SAR. The T2 does digipeating, so field teams can relay for each other if necessary, and it'll also output waypoints to your handheld GPS receiver. That means you can see where the other field teams are at, and the command post can send objects (with attached notes, if supported by the GPS) that'll show up on your map - search assignments, rendezvous points, or whatever.

I'm guessing that the cost for a finished unit will be in the $350 range, with most of that being the cost of the transceiver. Puts it out of the range of a lot of casual users, but I suppose it's in the same ballpark as a TH-D7A, which doesn't have nearly as much APRS smarts.

Depends on what you want to do. If you want to get a PC on the air, you can't get any cheaper than a software-based modem like soundmodem (for Linux) or AGWPE (for Windows) and a plain old sound card. I run a receive-only setup on a laptop with just a scanner and 1/8" mono patch cable.

For a transmit-only tracker, I'm partial to the OpenTracker, but I'm a little biased since I designed it and everything. =]

Eric,

You shoulg get all the other stations to upgrade to the new settings. That is really what everyone should do. We have changed things here in Maine and they work great.
If you can not get them to change their setups then you will change your "UIDIGI" to RELAY,WIDE.

I'm in the process of setting up a wide area digi and I've ran into a problem. I have a KPC-3 with the 9.0 firmware and programmed it up to the specs of http://web.usna.navy.mil/~bruninga/aprs/kpc3+WIDEn.txt.

The problem is if a user has the old path of RELAY,WIDE my digi will not repeat the packet it will only repeat if the user has a WIDEn-N path.

Allot of hams in my area are still running the RELAY,WIDE path so their packets are not being digi'ed when they are in my coverage zone.

So now the question. How do I get my KPC to repeater packets with the old path ? Is there a command I missed or config wrong ? Any ideas or suggestions would be great

Hi Eric,

Well if this isn't an interesting tid bit, I don't know what is. As I am one who is trying to re-enter APRS after an 8 year absence, this is very good to know. Though I understand Ron and Fran's frustration, it does seem to me that if the standards have changed not less than two years ago, at the very least, shouldn't the software gurus have done a little something to update default settings in new software downloads? Maybe I overlooked this as I dug through 'help' on WinAPRS and IU-View, lemme do a quick review to see if the software Gods on either side of the pond have made mention of this..... Ummmmmm, NO, no mention at all, in addition to mention in 'help' on either program.

Far be it for me to have rock throwing rights after such a long absence and though I am sure that every info site everywhere relative to APRS demands use of the new paths (although I for one have seen NONE), isn't it about time that the software Gods graced us with a revision? If nothing else, those of us who are n00Bz, or

those of us are rEn00bz are not going to have any clue that the default settings are no, according to you guys, completely useless.

I can see getting back in to this is going to be a total exercise in futility and frustration because true to form, amateurs have done NOTHING to help ensure that the uninformed are informed.

Many have, plus a lot of the web information has been updated to
show the new settings. Xastir has updated to the new defaults.

The new settings have made MAJOR improvements in the Seattle area.
The longer that people encourage or even allow the old settings, the
longer it will take to gain the advantages of the new system.

> I can see getting back in to this is going to be a total exercise in

The mailing lists have been full of this info for the last (almost)
two years. It is continuing to this day, so you'll see the subject
broached again and again on something like a weekly or monthly
basis. The big list (APRSSIG) is probably where I see it most
often.

Not difficult to tell something about UI-View - but as the author (Roger, G4IDE) died in september 2004, and the source code has been destroyed according to his wish, the UI-View help won't reflect the change which in 2004 was only for North America, and e.g. not at all (even not now) in use in the UK. In Europe, one are kind of divided as far as the North American "n-N Paradigm" is concerned. TF, EI and SP are following North America, in other countries both systems or ONLY RELAY,TRACEn-N are in use.
But most mobile stations aren't using PC software. The challenge is to change manuals for the popular T*-D7* APRS rigs.

These are the sorts of setups to consider:

Transmit-only trackers:
---
*) TinyTrak3, 2m HT, searcher's normal GPS.
*) OpenTracker, 2m HT, searcher's normal GPS.
*) microTNC, 2m HT, searcher's normal GPS.
*) Kenwood TH-D7A(G), searcher's normal GPS.

Digipeating + tracking:
---
*) Tracker2, 2mHT, searcher's normal GPS.
*) Tinytrak4, 2m HT, searcher's normal GPS.
*) microTNC+, 2m HT, searcher's normal GPS.

The Tracker2 and the Tinytrak4 are in beta-test right now.

The Tracker2 can track, digipeat, and also plot waypoints on the searcher's GPS corresponding to the APRS positions, all at the same time. This gives you situational awareness for all teams and base, plus you carry the network into the field with you due to the digipeating capability, so each team helps every other team get out.

The Tinytrak4 has somewhat similar capability but I'm not sure of all the details yet.

The TH-D7A(G) gives you the radio and TNC all-in-one, then you just have one cable from it to the GPS. It will also show you the positions of other teams on the GPS map screen, plus you can do 2-way messaging from the radio, but it won't digipeat. The Kenwood D700A will digipeat, but it's a mobile rig you wouldn't normally carry into the field (except perhaps motorcycle/quad/snowmobile).

Both the Tracker2 and the Tinytrak4 can be flashed with new firmware by the user, so as new software features are added or bugs are fixed, they are quickly available to the end-user.

I run an OpenTracker-1 in my Jeep but have also used Tinytrak2's and 3's (3's in the form of a Pocketttracker). I'm also a beta-tester for the Tracker2. For field work I plan to use the Tracker2 units.

I'm subscribed to the Tinytrak4 list so I'm attempting to keep track of that project as well. I'll buy whatever supports our SAR teams the best.

Good stuff out there now or Real Soon Now to choose from!

I do agree about trying to cut away from the old standard to the new standard. The only problem is sooo many of the local DIGI's and IGATES are running the old RELAY,WIDE paths so allot of new hams will set up to the old standard. I've done allot of looking at packets and I don't know why but texas and the Houston area have about 80% of the APRS traffic running RELAY,WIDE. I think allot of people really don't know about the new path. I know I didn't know about it till I started reading about setting up a digi and ended up having to put the new path in my tracker.

Maybe one of our computer savy people can write a program/script that will note all the people running the old path and get their email address from QRZ and send them a form letter and explane the new path.

Hi Jan and the rest of the gang. Thanks for all of your help guys. When I have time to get back in to the shack and attempt to complete the station set up (I have an issue with the ancient PC that will be dedicated to it at the moment), PLEASE, for goodness sake, do not hesitate to point out ANY issues that you may see with how my station is performing, or is not effecting the system (ku4my'at'charter'dot'net). I am here to learn really appreciate all of your feedback, thanks again for all of your help!

3839. RE: [APRS] Re: DIGI setup WIDE and WIDEn-N

Yahoo group: APRS (1998 — 2006)
Date: 2006-10-25 15:19:42 UTC
From: Armour, Randy (ITS)
Topic: 3826 Message: 3839

You have a good idea for a program/script to send a form letter via email. However, QRZ only displays email address information as a picture to prevent programs from grabbing addresses and generating spam. The QRZ site administrators might be willing to provide such information as a special request. I don't know how difficult that process might be. There may be other avenues to get email addresses, as well.

Another thought is to periodically generate an APRS bulletin message asking local users to consider using WIDEN-N instead of RELAY,WIDE. Any APRS station could generate the bulletin. If you could convince the operators of digipeaters in your area to generate bulletins on a regular basis, any active APRS user should get the message. Digis that still support RELAY,WIDE and/or have wide coverage areas are perfect candidates.

Subject: [APRS] Re: DIGI setup WIDE and WIDEn-N

I do agree about trying to cut away from the old standard to the new standard. The only problem is sooo many of the local DIGI's and IGATES are running the old RELAY,WIDE paths so allot of new hams will set up to the old standard. I've done allot of looking at packets and I don't know why but texas and the Houston area have about 80% of the APRS traffic running RELAY,WIDE. I think allot of people really don't know about the new path. I know I didn't know about it till I started reading about setting up a digi and ended up having to put the new path in my tracker.

Maybe one of our computer savy people can write a program/script that will note all the people running the old path and get their email address from QRZ and send them a form letter and explane the new path.

It's a relatively easy thing to do. You'd get a lot of hate mail
back telling you to mind your own business though.

Typically the digi owners are more tech-savvy, so they're often the
ones that know how to improve the system. If you concentrate on the
digi owners to get them updated, then the user base will follow by
necessity. Their working paths will stop working and they'll have
to learn something new.

Here in the Seattle area we went whole-hog into the new path
paradism and the users adapted quickly. They had to. Saved us a
lot of trouble instead of going with dual-paths for a while and then
trying to edumacate all the users as to the benefits of the new
path. We set a date and just changed over.

The only to get some folks to change is to make their
equipment not work until they fix it. Like the folks that
drive on bald tires. They won't fix it until they have a blowout.

All you need to do is to get the digi owners to shut off RELAY
and TRACE. When the users don't get digi'd they will change.

I've found that maybe 1 in 100 callsigns overall have an email address on file.
This is especially true of eBay sellers.

If the person is already on email, for example a yahoogroup user, it's
maybe 30-40%.

After QRZ you can try (callsign)@..., but that's not a guarantee either.

My thought process here could be considered cruel by some. I'd set it up with the new standards and let the old packets simply drop. When their packets don't make it though your digi they will begin to ask "Why" and that's when you can explain the "Why" to them. By limiting what you digi to only the newest standards you will force people to ask questions. While that sounds harsh on the surface when they realize why you are doing it I think they'd be more understanding.

> to the old standard. I've done allot of looking at packets and I don't
> know why but texas and the Houston area have about 80% of the APRS

Ya I know. Most days I get a least a couple packets that make it all the way from Northern Texas into my digi in Central Nebraska. When the band is up those packets go through the roof. I've even seen a couple that started WIDE7-7 making it to me as WIDE7-3. That means it could be making it all the way to South Dakota or Western Iowa.

Been there done that....err sort of. Did most of it manually for several months. The response you get back is strangely mixed. 96% say..."Sounds like a good idea, but I'm not going to change". 1% deny it's a good idea and 1% will send you the most hateful emails you can imagine. Most of them go something like, "APRS is a great hobby why are YOU messing it up". They seam to think that anything you can do to lower QRM is contrary to good Amateur Radio Operation. And 2% actually change there settings. It's hard to get

Amateur Radio Operators that are used to seeing just how FAR you can send an HF signal to understand that distance is the enemy of APRS. The Amateurs that have any networking (IT) knowledge understand that flooding a network with extra packets is very harmful but a LOT of Amateurs simply don't understand it. Mostly they don't understand it because they don't take the time to really have somebody explain it to them.

I think one of the biggest reason people don't understand the problem is because the APRS-IS (Internet side of APRS) only takes ONE of the many packets that make it to the web. I'm not faulting the system, it's designed to not except duplicates on purpose. Since people only see ONE packet making it to the Internet I think they don't realize just how much further it could be going. The only way to find out just how far you are spreading QRM is to find the individual logs from each machine in a two or three state area and do some searching through those logs to see just what they've seen.

I started a Perl script several years ago called the Hog Counter.
Others have taken it over and added to it through the years. It's
running on a machine right in the center of Seattle and is listening
to RF packets only. It's a great tool to see who's using/abusing
the system. Go to http://www.eskimo.com/~archer and click on the
Hog Counter link on the left.

If others want to run this code in your area you're more than
welcome to.

3849. SAR/APRS mailing list

Yahoo group: APRS (1998 — 2006)
Date: 2006-10-30 19:00:49 UTC
From: Curt, WE7U
Topic: 3849 Message: 3849

In order to try to get people with similar interests collected together in one place, we now have the "SAR_APRS" yahoo group.

We intend to keep the focus on emergency groups only. "Normal" and public-service APRS operations already have many excellent forums to discuss such things.

Discussions about the use of APRS in SAR and similar organizations ends up getting spread across many mailing lists, making it difficult to collect a critical mass in one place.

If you have an interest in using APRS for SAR and/or other emergency groups, please subscribe to this list:

<http://health.ph.groups.yahoo.com/group/SAR_APRS/>

3850. APRS Remote Control!

Yahoo group: APRS (1998 — 2006)
Date: 2006-11-01 01:37:58 UTC
From: acentient_software
Topic: 3850 Message: 3850

Dear Radio Amateur,

Please forgive the slight commercial nature of this announcement, but I have developed a new home automation application that can be remotely accessed via an APRS equipped amateur radio, which I thought this group would find interesting.

For more details, please see my press release below.

Best regards,

Robin Grunwald, G1VJW
admin@acentient-software.com

# # #

Acentient Software has just released v1.02 of Adaptive Home Logic, a new multi-purpose home automation application for Windows XP, which introduces the unique concept of being able to remotely control your home automation system or electronics from an APRS equipped amateur radio, via the APRS amateur packet radio network, independently of anyone else's communication infrastructure.

This makes it particular useful for monitoring / controlling systems or equipment where the other forms of communication are simple not available, possible or prohibitively expensive, such as an automation system at a remote / rural location, in a mobile home, yacht or RV, etc. The program can also be used to transmit telemetry to an APRS station on a regular schedule or automatically when an event is triggered.

This new program, which can interface with many home automation peripherals, generic serial devices and parallel input / output boards, integrates many advanced features to offer wide ranging flexibility within an easy to use and understand application.

Featuring Scheduling / Conditional Events, 2-way Speech, Remote Control & Reporting (Internet / Amateur Radio), Digital I/O, Serial Data (RS-232 / RS-485), X10, File Data, E-Mail Alerts, Sunrise / Sunset, Screen Overlay Scenes, Data Logging + More!

The program can also be used to form the basis of a simple or sophisticated home automation system, as well as for other automation applications.

For more details, please visit www.acentient-software.com

Adaptive Home Logic is currently available at an introductory price of just $34.95

As far as I understand, what you list is the recommended
setting in the US.

Can be found at
http://www.activeham.com/index.php?option=com_docman&task=cat_view&gid=22&Itemid=51

UI-PHG try to plot a range circle on your map, for those
nodes that has listed a PHG value in their beacon.

UI-ALOHA try to determine how far it is useful for you to
transmit your own packets (depending on the number of
packets heard per minute on the radio channel).

/Robert Lind

Below is the URL again, but manually split, to fit into
the line width. Needs to be recombined before it is
useful in a browser.

My tracker's use:
WIDE1-1,WIDE2-2

This gives you at the most 3 hops....

Otherwise:
WIDE1-1,WIDE2-1

This one give 2 hops at the most....

I would not go higher...
The "WIDE1-1" will let you get digi'd by home/fill in sites...which bounce you to the higher/bigger digi's and they bounce you at least one more time...plenty of bounces to get into the system....for the most part.

Some places in the boonies might need to bounce more than 3, but not really likely in most of the area's...

Hope it was helpfull!

3855. APRS and pre/de-emphasis dilemma

Yahoo group: APRS (1998 — 2006)
Date: 2006-11-03 12:27:06 UTC
From: Eric
Topic: 3855 Message: 3855

After wiring up my tnc to a Motorola m120 for a wide area aprs digi I started wondering about the audio handling. Being a voice repeater builder I'm in the habit of always using discriminator audio and the flat tx audio port on radios so the audio passes through the repeater without being degraded due to being de-emphasized and re-emphasized when its already emphasized.

But since this radio is being used for packet it got me thinking if this was acceptable or not. I know most hams use the radios speaker and mic jacks to hook up their tnc which results in the audio being processed/de and pre-emphasized. But I've seen a growing number of hams that use the radio's discriminator output to feed rx audio to their tnc which results in audio that has not been de-emphasized being feed into their tnc. But then they add insult to injury by running the tx audio from the tnc into the radio's mic port which results in the tnc's audio being pre-emphasized on the way out. So they have a node that is sending processed/emphasized audio but not configured to receive it.

Since packet radio is only 2 tones (mark and space) does it make much difference? I did a google search and some say it's critical and some say it doesn't make any noticeable difference at all.

I may be looking too deep into this and it maybe a non-issue but I thought I would throw this out here and see what everyone's thoughts/experiences with it where.

So as to quote Shakespeare, to emphasize or not to emphasize that is the question.

Eric Kc5fog

Just a data point: In the U.S. Pacific Northwest we recommend "WIDE1-1,WIDE2-1" for mobiles or "WIDE2-2" for home stations (both two-hop paths). If you're seriously in the boonies then the three-hop path you listed above is ok for mobiles, and "WIDE3-3" for a home station. I use WIDE1-1,WIDE2-1 in my Jeep and get fantastic paths (20W to 5/8 wave antenna, ~30 mi. north of Seattle, OpenTracker TNC).

In more northern Canada they sometimes run longer paths yet because the APRS infrastructure is sparse and the number of users is small.

The main thing is, join your local group or at least ask a few of them what the recommended paths for your area are. The first one or two might "invent" something, so look for consensus. ;-)

You can also look at the raw packets (with practice) to see what sorts of paths are being used. They do get munged a bit on the air so it does take a bit of knowledge sometimes to figure them out. If you can see some stations packets direct (no digipeater has acted on them yet), then it's easy.

This has been brought up several times on APRSSIG. As I recall the Kenwood APRS radios don't do any pre/de-emphasis, but nearly everything else does. If you go 9600 baud, you _have_ to tie in to the discriminator else things just won't work right.

For 1200 baud, some TNC's have filters in them for adapting to the *emphasis of the radios, some do not, so you may even have to disable the filters if you hook straight in.

My personal preference is to stick to the pre/de-emphasis method for user stations, as that is by far the most common, but the problem with that is the wide variance in how this filtering is done, and of course most people don't account for it in their setups. Heck, most people don't even adjust their packet deviation down to the 3kHz range, so most of them are running way too hot.

The problem you run into is an XX-dB loss if you have pre-emphasis rigs talking to no-emphasis rigs. I don't recall what that loss is exactly, but it's measurable.

I've often wondered the same thing myself. Of course it makes a difference!

Putting aside (for the moment) that FM is not a weak signal mode.....

What happens when the 1200 Hz tone and the 2200 Hz tone is stronger/weaker by a factor of 3 db? For packets anywhere near the noise floor of a receiver, one tone will be decoded, the other one will be a near miss. This happens whether you are talking about the receiver or the transmitter. One way or another, you need a transmitter twice as strong to compensate for the loss of one of the tones (or a receiver with a 3 db better noise figure).

So, of course it matters.

It seems to me that there should be a standard for packet, but there isn't. Either do it or don't, but don't leave it up to the node builders imagination and/or the user to do it one way or the other::>

An FM voice repeater becomes 10 db poorer on receive if the users PL tone is 10 db down as they transmit. For local traffic, this is not a problem. But users in outlying areas, will find themselves unable to access the repeater after the owner switches to PL. And mobiles go out of range much quicker with PL on. The same thing happens on packet, although the margin is not degraded quite as much.

This is simply not the case at all. Most CTCSS decoders work well into the noise level where the voice or other concurrent information is completely unintelligible. These decoders have a very narrow bandpass. Since they are only looking for one frequency they can be very selective and sensitive.

In my experience I have never seen any loss of range when going to tone squelch. Actually, it usually increases in that the carrier squelch control may be set much looser.

I don't really think the two-way gods would have stood for a ten db hit when they came up with tone squelch 45 years ago.

If you are loosing range using tone squelch then something isn't set right.

To keep this APRS oriented, the proper setting for 1200 baud FM packet has always been 3 to 3.4 khz deviation for either tone. The high tone may be up to one db hotter, but never lower, than the low tone. Pre/de-emphasis is important only as a mechanism to achieve this tone level. This has been the standard since packet was hot back in the late 70's and 80's.

I didn't speak to the "how" in my last message, sorry.

For the KPC3, try these settings:

<http://nwaprs.info/mobilesettings.htm>

For the MFJ, look for TAPR2 settings on the 'net. This typed into
Google yields a few possibilities:

tapr-2 aprs mobile

Yes, if you have firmware that supports APRS. For the MFJ you might have to get the latest TAPR-2 EPROM (which is quite old now) to update it for APRS.

A KPC3 can do it as well. A newish KPC-3+ can do it even better, with a separate software-done serial input port for the GPS.

If you only want transmit while mobile and won't be hooking a laptop or PDA to it, consider a OpenTracker or TinyTrak3. An OpenTracker kit is something like $29. TinyTrak is near that price range as well. You can buy them with/without case, assembled or as a kit. I personally run an OpenTracker-1 and love it.

Hi to all
I am trying to set up an APRS relay for my area and am a bit overwhelmed with all the information I fined on the internet. I look one place and it tells me to do it this way. Then I look some place else and it tells me to do it a different way. I don't know which way is the correct way. Is there some place that has just the most current information on setting up a relay station?
The TNC I am using is a KPC-3+ with VER. 8.3 software.
Thanks
Roger

Here is a Wiki page that should give you very up-to-date information
most of the time:

<http://info.aprs.net/>

Check the "Path Settings" page to start with. The "fix14439" page
is linked to that page and has further information.

I use a Paccomm Handipacket TNC in KISS mode with UI-View32
running on a laptop. I believe the HandiPacket can be set up as
a tracker, but I've never done that.

I was assuming that Kim was after a standalone tracker, with just the TNC/Radio/GPS, but that might have been a poor assumption on my part.

Nearly any "old" TNC will work if you hook it to a laptop and run APRS software, even those TNC's that were created before APRS was invented. You can run them in serial command mode or in KISS mode to do this.

I prefer KISS mode in this case as there are fewer things to screw up. In KISS mode, the APRS software in the laptop makes all the decisions plus there are only about 5 KISS settings in the TNC itself, which the laptop software controls as well.

I did want to keep a standard path on the D7 for the sake of those with me (there were five D7s going around). All radios have different SSIDs and/or callsigns programed. I was trying to use standard paths and not car specific paths because my car would not always be visible from the trail.

So given that I want a real fill-in digipeater and standard paths on the D7s (not call specific paths), what did I miss to be digipeated properly?

The largest Parade on the West Coast (except for the Tournament of Roses in Pasadena) is the Mother Goose Parade, held this Sunday Nov 19 in El Cajon Ca. This is an immense parade, with hundreds of floats. bands, etc going over about a 4 mile route though downtown El Cajon. It may be broadcast nationally, but sure is locally. The Amateur Radio Club of El Cajon is honored to be able to enter a float this year, that will feature live Amateur radio stations on HF and VHF using the club call WA6BGS. But there will also be an APRS tracker on the float, a self-contained 18W unit featuring a Byonics Tiny Tracker 3, and Axiom GPS running into a Kenwood HT and homebrew PA. Look for WA6MHZ-15 on FindU to see how the Float is progressing down the route. I will turn it on around noon Pacific time and it will run until the parade ends about 4 pm. We probably won't move until somewhere around 1PM due to all the folks ahead of us. Don't know where in the line up the ARCEC float is. The KA6DAC and WA6MHZ-10 Wides should pick it up along the entire route so it will show a nice track. Hope all goes well, I just charged up the Bat and it is ready to go!

3886. FT-2600M to KPC2

Yahoo group: APRS (1998 — 2006)
Date: 2006-11-19 05:23:17 UTC
From: Jeff
Topic: 3886 Message: 3886

Hi all,

I'm setting up an APRS station using an FT-2600M and a KPC2. I'm using UI-View32. Everything seems to be working fine except that even though the radio and tnc are talking to each other and transmitting rf power, I'm not receiving information on other stations (my existing home station and HT).

I exchanged the KPC2 for a KPC3 just to see if something was wrong with the KPC2, but still have the same problem. I lowered the mic gain in the radio, but still have the problem. I clipped the jumper in the KPC2 and applied another jumper as per the manual's requirement for rigs that TX to ground (even though I had already tried the KPC3), still the same problem. I turned the microphone "OFF" and "ON" in the menu, but that didn't change anything.

The FT-2600M transmits fine on FM Voice.

I use the DB9 Data Connector on the back of the radio for the packet connection to the tnc.

Here is the current pin out for 1200 bps connection:

FT-2600M Pin 4 to KPC2 Pin 1 TX
FT-2600M Pin 5 to KPC2 Pin 6 Ground
FT-2600M Pin 7 to KPC2 Pin 3 PTT
FT-2600M Pin 9 to KPC2 Pin 5 RX Audio

FT-2600M Pin 9 to FT-2600M Ext. Spkr.
FT-2600M Pin 5 to FT-2600M Ext. Spkr. (ground)

I'm missing something, can someone help me? Tnx very much.

Jeff/KU4WW

3889. Radio that automagically change freq at a data burst

Yahoo group: APRS (1998 — 2006)
Date: 2006-11-19 20:00:16 UTC
From: rhlind
Topic: 3889 Message: 3889

It seems to me that when a radio is used to transmit APRS it would be useful to have two different PTT inputs to the radio, and they behave differently.

One for data transmission (ordered from the TNC), and another ordered from the headset/monophone (for voice).
If then one of the PTT can be set to use VFO A, and the other PTT can be set to use VFO B, it would be possible to use voice on one frequency, and interleaved with that, an occasional APRS data burst (with lower priority).

Perhaps the Kenwood radios with a built-in TNC already has this feature ?

Is there perhaps other radios that can do this ?

I do it all the time it depends on the setting you use, you can stipulate if a transmitts while b is in use or not.

Not many radios have the sort of inputs you'd need for that. I'm looking into something similar for the commercial Kenwood TK-760 though - it'd stay on the voice channel until its timeslot came around, and (assuming it's not busy with voice) would switch to the data channel to send a packet and then switch back.

Modern commercial rigs typically have an accessory connector that you can program with functions for that sort of thing, though. Ham rigs usually don't. The Kenwood D700 might. I'm also hoping the Alinco DR-135T will be able to take some commands from the internal modem board, but the interface isn't documented, and the TNC header doesn't seem to provide the mic PTT signal anyway.

Motorola GM300 series had that feature from the accessory jack in the rear of the radio; you can find them on eBay if you look. The Kenwood series TK-730 did as well and they are also on eBay.

Just a thought and I have a few pages linked to pin-outs on the jacks as well.

Yes, the Kenwood TM-D700 does this (sort of, but much better). Also, you could just buy a second radio to dedicate to APRS.

I have my KPC-3 hooked into the back of my GM300 from Motorola and it keys up on aprs just fine. Have a two channel model for APRS specifically.
The link to the pages I found the pinout is:
http://www.irlp.net/pnp-radio-pinouts.html
Shows both the front and back of the radio for getting a tnc hooked to the radio.

Hope this helps

Found several on eBay for around $100

>Will I run into problems since my KPC is running only version 6?

If your TNC will accept being run in KISS mode, it'll do whatever
UI-View is telling it to do. It's UI-View which is processing the
signals and doing the digipeating.

I have a KPC-3 with v 5.1 firmware and it works okay with UI-View host mode KISS using the easy setup Kan.

Hello Jan,

Thanks for responding. I finally got it to work. I have been trying to get it to work in KISS mode all this time with no success. I changed the UIView32 host mode to "none" and the hardware handshake to xon/off. The TNC and application are working great. The map is now populating with the stations that it hears.

Thanks,
Dave

Hi, Dave;
I should have expected that the question would arrive at the ui-view
list as well... anyway, glad that it works!

3904. Tracking Data "Jump"

Yahoo group: APRS (1998 — 2006)
Date: 2006-11-23 17:05:04 UTC
From: genied7
Topic: 3904 Message: 3904

I wonder if anyone in the southern California area has experienced the following "artifact" in APRS track recording.

When I am out travelling around San Diego County with my GPS/APRS setup transmitting my location from the car, and then review the track of the trip when I get back to my QTH where it is being recorded while I am gone, I frequently find a "jump" in the data which indicates that at one point in the trip I am reported at a location no where near where I have travelled.

Following is a fragment of the position data reported for a trip I took down around the San Diego Bay yesterday.

N32ø37.640' W117ø08.310'
N32ø36.980' W117ø08.110'
N32ø36.240' W117ø07.500'
N33ø39.040' W114ø12.590'
N32ø35.040' W117ø06.630'
N32ø35.040' W117ø06.380'
N32ø35.030' W117ø05.600'

You can see that the position recordings made sense until the fourth one down which indicated an anomolous "jump" to a location out East.

All of the data is via RF and, of course, some of it is digipeated by stations such as WB6WLV-15 or one or two other regular digipeater stations.

My impression looking at the complete data string is that at some point the digipeater either mixes my position data with another station or sends its own position as part of my string instead of my own.

I experience this kind of "jump" in the data once in almost every trip beyond the area immediately around my QTH.

I queried one of the APRS guru's about this artifact and he indicated that he had seen it occur when the data was arriving by the internet but not when the data arrived by RF.

Anyone else in the San Diego area see this kind of anomoly?

73,

Ed

When I flew my high altitude balloon a couple of weeks ago, I got some really big jumps - not sure if they came from the San Diego area, but it should have been in range. There's been a lot of discussion on the APRS SIG about delayed packets. I think most had been narrowed down to one particular IGate program - might have been UI-View32, but I don't remember.

One thing that can cause it on just about any platform is a bad DCD. If the TNC at a digi thinks the channel is busy all the time, it'll queue up packets in its buffer and they can sit there for a long time until the channel appears clear again.

Hi Scott,

According to the time stamps in the complete data packages, the "anomalous" lat/long report fell right into the time sequence so it is hard to tell that it was delayed.

On the other hand, that could be part of the problem.

Thanks for reply,

Ed

Scott-
"One thing that can cause it on just about any platform is a bad DCD.
If the TNC at a digi thinks the channel is busy all the time, it'll
queue up packets in its buffer and they can sit there for a long time
until the channel appears clear again."

Is the TNC replacing the original timestamp in the original APRS string? That
would seem to be wrong on every level, in my limited understanding of the system
I didn't think that was done that way. Is it??

Also wouldn't explain the jump--UNLESS the station had been at that other
location some time previously. I'm wondering if the explanation could be
simpler, i.e. data corruption along the way?

No, that won't account for the timestamp jump. Sounds like a screwed up IGate to me. I know there was some investigation into this, and I seem to remember that UI-View32 was implicated in most cases. Maybe it's a TCP/IP buffering problem?

And of course, if it's just a changed byte and not a delayed packet, it could be from an IGate with a bad serial connection. That's about the only part of the link with no error checking.

How about a small TNC that can be used as a TNC with a laptop to create a digi, gateway or just to watch local trackers. Built in USB connection for use with modern computers without serial ports.

The same device can be used with your GPS and radio as a tracker. It has an internal battery for extreme portability. Dimensions 21 X 60 X 43 mm or 0.8 X 2.3 X 1.7 inch

Check out the uTNT from Elcom at

Hi Dave

The only I know is from EI8IC´s Ham Radio Resource Site
http://www.mapability.com/ei8ic/
and presents no details. I have never observed APRS activity on the
Falklands using live information at GoogleAPRS (www.googleaprs.com).
Anyway this could be a very nice place to put also a Satgate for the
ISS and have a better coverage of South Atlantic/America.

3921. Re: [APRS] Re: Maps wanted please.

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-07 10:34:47 UTC
From: Dave Aitch
Topic: 3918 Message: 3921

Hello Francisco,

Thank you for your reply.

I had already looked for available maps but non found
so far, hence my question to the group(s).

There is APRS activity on the Falklands.
Not a lot, but it is there.

Cheers,

Dave.

I haven't the slightest idea but my guess is they would. All I do is select the map size and then save it to disk. It saves it in a BMP file and that works fine with IU-View32. Just read the help files and it will tell you how to do it.

3926. Somewhat OT: Garmin StreetPilot III

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-08 05:28:38 UTC
From: mikemorris99@gmail.com
Topic: 3926 Message: 3926

A friend has Garmin StreetPilot III and the backlight
has gone out.
Then the center pin of the cigarette lighter plug fell
out and is missing (this is the model that had the
speaker in the plug assembly).

Don't have the unit in hand yet so don't know the
whole situation....

Is either of these two problems something that has
happened to others?

If so is it / are they fixable by a technically competent ham?

...or does it need to go back to Garmin in Kansas? They're
talking $300 to fix it and update the maps.

I'm a newbie to this APRS stuff and I need some good ole' fashion mentoring... LOL You can contact me off the list or thru the list it doesn't matter to me.

This is the equipment that I currently have that I will be using:

PK-232MBX with 7.2v firmware
DeLORME TripMate <>I do realize I will have to modify this for it to work.

I have also been told that I will have to have my laptop connected to the TNC at any time that I want it to send data to the APRS network and that is ok with me that is how I want it. The laptop will be removed from the vehicle every day/night all the TNC equipment and radios will be permantly installed in the trunk and I will be running the neccessary cables to the trunk.

I am currently trying to secure a KPC-3 and I'm under the impression that if I have that when I remove the laptop it will still report my info to the APRS system is that correct?? If so, that is fine as well... I just can't afford to leave the laptop in the car and it come up missing... lol

Also, what do I have for choices when it comes to software what do you recommend?? The laptop I'll be using will be running WinXP Pro w/256MB RAM 40GB hard drive and it's a 900MHZ processor...

Like I said I'm new at this so please be patient with me :-D

73s,
Jonathan

If you can't find a KPC3 you might want to look at the TNC-x (www.tnc-x.com) . I run that with my laptop with the UI-View software. You can run the TNC-X with the Tracker-X daughterboard, with or without the laptop. The tracker actually transmits independently from the laptop. In my case the tracker does all the transmitting and the TNC feeds the laptop when connected so That I can message and/or see other stations using UI-View

I've been playing around with piezoelectric motion sensors like the type used in car alarms. They're really more useful for detecting motion than orientation, though. I've seen some mercury-free tilt switches that might do the job.

Isn't there anything out there that'll do it off the shelf? I know we had an Alzheimer's patient or two around here outfitted with trackers after one too many walkaways. You'd think there would be something for summoning help that didn't involve exorbitantly priced subscriptions.

I don't feel that $30.00/month is all that bad for a
monitoring service. It's the initial cost of the
equipment that stops me!

I've also looked into an Avalanche locator and they
are around $300.00 AND you HAVE to buy TWO of them
because they locate each other!

There's GOT to be something more reasonabley priced.

COOL! I wonder if they have anything that would emit
an RF signal for tracking? I need to make or buy
something that is small, yet powerful enough to be
received from about 1/8 mile. They live on a 13.5
acre farm with LOTS of Christmas trees that can hide a
body quite readily.

Maybe this really isn't off topic as it concerns
tracking someone.

Thanks for the ideas, keep them coming!

Might want to give these folks a call at their 800 number.
<http://www.com-spec.com>
While they have trackers for dogs, cats, model aircraft,
they are probably worth the phone call.

Please let us know what you come up with. Some
of us will be in the same situation in a few years (i..e
with elderly relatives).

I realize this doesn't fit your requirements, i.e. only transmitting when horizontal or inactive, but have you considered something like the micro-trak 300, and just having it beacon position every 5 minutes or so? Obviously you would always know (within 5 minutes in this case) the location of the tracker, so that when he goes missing you'll have a good place to start, when he's not missing, you're just dumping 12 packets per hour into the APRS network for a decidedly noble cause. You could even setup the path so that it would only hit a local station, and not be digi'ed or igated.

Overkill when he's not missing, but certainly piece of mind value is there, other benefits include, knowing its working all the time, simplicity, and not having to be 'horizontal' or stationary to trigger anything.

Just a thought.

Curious as to what frequencies they are using as I have Doppler and scanner if the frequency was right could be used for the tracking instead of the handheld unit. Thanks for the information though, might have to give then a shout myself.

Might want to give these folks a call at their 800 number.
<http://www.com-spec.com>
While they have trackers for dogs, cats, model aircraft, they are probably worth the phone call.

Please let us know what you come up with. Some of us will be in the same situation in a few years (i..e with elderly relatives).

Check out Project Lifesaver. We have a program up here in WA as part of SAR where we put tracking bracelets on these types of at-risk individuals. When they turn up missing we go out and track them with receivers. For a trained team the find time is pretty amazing. They don't have a GPS in them, but using standard DF techniques you can usually track them down fast.

See if your county has a Project Lifesaver program. Contact SAR or the county sheriff's department and ask.

Good topic and potential application. I did a Google for 'man down alarm' and came up with a few ideas.

Someone already mentioned the firefighter PASS, or Passport concept. I'm worried about what a loud noise coming from a PASS would do for the person. He would be likely inclined to remove it, or hurt himself trying.

Motorola (and maybe others) are working on systems that use time of arrival and triangulation to find out where in a building where a FF is. For a multi-floor building, the first ones in would drop lunchbox sized units in the stairwells to get reference points above ground level. Compared to APRS trackers, the portable units are dumb, they just radiate a signal. It's when they're received by the fixed points that's important.

Some of the same concepts could be used outdoors. What's complicated for them today may be shipping in bulk from China a couple years from now.

Another concept may be to put a transponder on him, not unlike the ones used by when someone is under house arrest. http://www.freepatentsonline.com/5448221.html http://www.freepatentsonline.com/7119695.html When he goes beyond the house and the driveway, and loses signal at the base station, a family member would get a call. An audible alarm on the device would remind him to get back into the house before someone gets called. http://www.stopllc.com/pdf/BluTag.pdf A bit mean to use prisoner technology, but if his condition is getting bad, this could be a life saver.

I think you're on to a good application here. Sadly, there is going to be a growing need for this type of solution.

Though it will not track, a PASS alarm that firemen and other SAR people
use will make a large audible sound in that case.

LOTS of GREAT information, PLEASE keep it coming! I'm checking into them as fast as they come in.

THANKS!!!

Because most of these tracking units are soooo expensive and have limited range, I was wondering if anyone has thought of or knows of a device that would emit a beep or pulse that could be used with an FRS radio? FRS radios are cheap, could me mounted in a small back pack or vest pocket (as IF I could ever get my dad to wear one).

APRS is just a radio in the field, with a GPS, Mini-tracker, and radio. The receiving radio is connected to a TNC and a computer. Is this basically correct??

Since the APRS signal is momentary in nature, couldn't this system work with FRS as well??? It's VERY limited in range, less than two(2) miles (especially in the area or my folks place) and most likely would NOT interfere with any other radios. You can buy some REAL SMALL radios, cigarette pack size that might work as well, making the footprint even smaller.

What do YOU folks think?

Brings up more ideas...

One of the things I was asked to do quite a while back was add support for Garmin RINO radios. These at the time were either GMRS or GMRS/FRS radios with build-in GPS, which transmitted out coordinaates at FRS power levels and could be polled. Garmin had to get an STA to send the coordinates over theses channels.

Well, if you now go to the Garmin RINO site you'll see they have another STA that lets them send out coordinates at GMRS power levels.

In any case, with two such radios, GMRS or FRS, you can manually or automatically poll one of the radios from another. We have code in Xastir to do just that, poll any RINO radios that have an ID that starts with "APRS"... We plot their positions on the map and send out APRS objects with their positions as well, at least if you also have a connected APRS TNC/Radio.

So, with two of these radios, you can have one on the subject and poll their location manually from the other radio. Make them the GMRS variety and you have additional range, but in that case it'll be about an $80 per five-years license.

Curt,

You mentioned that you had to add support for the
Garmin Rhino 110. Was that to your LOCAL APRS
service, or was the Internet wide?

I've looked on line and those are some rather complex
radios, but a NICE thing to have!

Thanks!

Rod

In this case it was a setup where the user wanted to be able to have RINO's and APRS units on local RF and track all of them via Xastir. For this configuration you need a RINO on a pole hooked to Xastir via serial cable, then a TNC/radio/antenna also hooked to Xastir. All of it was local RF.

I don't think he was hooked up on the internet and sending APRS objects for the RINO's out there, but that should be possible as well.

The system would poll the RINO's periodically and they would answer back with their position. Xastir created APRS objects for each of them and transmitted them out on 2m. You can of course skip the APRS stuff and just used RINO's in your case, and in fact it should be possible to do a similar thing in software to what we did in Xastir, having one RINO/computer polling a remote RINO, then calculating the distance and sounding the alarm if it's too far away.

Rod,

The FCC rules governing the FRS prohibit attaching a tnc or tracker to a FRS radio. Packet radio via an external tnc or tracker, which is what APRS uses at its message transport layer is specifically prohibited on the FRS.

Check out the MicroTrak-300 at http://byonics.com in kit form it is less than $100, and it is the radio, and the tracker all in one unit. Its about the size of a double pack of chewing gum. All you would need to add is an antenna, a gps, and a power source.

The whole kit could be made stealthy enough to be sewn into a jacket, and providing you have a good receing location on the tree farm, you should be able to track anyone wearing / carrying it with ease.

For monitoring / locating, all you'd need would be a scanner, and a computer with a sound card.

Erik
KI4HMS/7

BTW, I have no fiduciary interest in Byonics or VHS Products, just a satisfied customer of the former.

Hey,

As for the gone vertical, if you were to build a circuit or add to, consider an accelerometer. You would only need a dual axis one (X&Y). ADXL213 from analog.com. This can read if he is moving forward. If he is horizontal, it will measure 1g. The range of this chip is +/-1.2g's other values are available. These are the same types of chips used to turn off displays of flip cellphones and laptops. Some additional circuitry will be necessary and the output is PWM.
I am not sure if this helps any, but good luck

Some of the same concepts could be used outdoors. What's complicated for them today may be shipping in bulk from China a couple years from now.

Another concept may be to put a transponder on him, not unlike the ones used by when someone is under house arrest.
http://www.freepatentsonline.com/5448221.html
http://www.freepatentsonline.com/7119695.html When he goes beyond the house and the driveway, and loses signal at the base station, a family member would get a call. An audible alarm on the device would remind him to get back into the house before someone gets called.
http://www.stopllc.com/pdf/BluTag.pdf A bit mean to use prisoner technology, but if his condition is getting bad, this could be a life saver.

I think you're on to a good application here. Sadly, there is going to be a growing need for this type of solution.

Not knowing the family dynamics, or the target / subject involved,
the only reference I have for the situation is a friend's late aunt
who had alzheimers, and wandered away from home occasionally.
I helped him design a solution that while not perfect was definitely
"good enough".

When his aunt walked away from home and got lost she ALWAYS
was fully dressed, put on her jacket and took her purse... every
alzheimers patient is different.... he found her everywhere from
the local supermarket to church to the donut shop.
And she realized that she was not as sharp as she once was and
always took the same coat and the same purse.

He took advantage of the purse and put a 250mw high band
transmitter under a false bottom (with a wire antenna in the strap).
The power source was two 8-packs of series parallel AA penlight
cells.
This was pre-GPS days so he used an 8-element PVC quad at the

house for an initial bearing and a Happy Flyers version of the
L-Per design as the close-in locator... he got some strange looks
as he walked through the shopping mall.

In the case of Rodney's 83 year old father.... if Rodney can take
advantage of his ALWAYS wearing a certain jacket I'd sew the
micro-track into the lining, an antenna into the front button strip hem,
into each sleeve lining and a fourth into the center of the back,
them phase them so that the patterns radiate into as much of a
360 degree pattern as they can (yes, NASA did research
on this in the 1970s as a backup spacesuit antenna... having
been out of NASA since 1978 I just don't know who to ask or
where to look it up).
Then I'd put the GPS antenna into the area at the top of the back
behind the collar - I've seen ones that aren't much bigger than half
of a golfball.
For a power switch I'd put a normally closed reed switch in the
collar and a magnet in the peg it hangs on. As soon as dad
lifted the coat off the peg the switch would close and the tracker
would go live.
If the GPS had local memory it would have a fix within 5 minutes.

At the house a receiver - which could be as simple as a $50
Maxtrac off of ebay set up as a tabletop base - feeding a sound
card and a PC. Use a cheap low power 2-freq one and program
only one channel. Put a decent antenna up 10-15 feet off the
ground and you would hear the 300mw microtrack over the
entire property and probably further.
Then once you had a location fix you could take a chalkboard
eraser sized GPS and walk right to him.
Or as a bonus give the walker a handheld that talks to the Maxtrac
and the person at the base can guide him right to the target
(especially if the walker has a second microtrack... then it's a case of
"he's 25 meters from your at your two-o-clock".

Let us know how it works out, please.

3952. Looking for more information

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-11 05:28:55 UTC
From: Roger
Topic: 3952 Message: 3952

First off I want to say thanks to all that responded to my last request for information on setting up my KPC3+.
I now have it receiving and transmitting something but I am not sure if it is working correctly.
When I check on http://www.wulfden.org/APRSQuery.shtml I see that it is updating my position as it should as set by BLT settings.
Question #1
My question is this the only time this sight is updated or should it update every time my station transmits something?
Question #2
When looking at the data string on my computer when I transmit I don't see my call in the string.
Should I see my call some where in the data being transmitted from my station?
Thanks
Roger

Because of the restrictions on FRS radio, that's out!
And because he's NOT a ham, APRS is out!

HOWEVER, I was told, by someone on this group about
the Garmin Rhino 110! They are around $150.00 each
and you need two(2) of them to work. I told mom about
this and she's NOT against it! I'm still going to
keep looking, but this sounds like a very viable
solution!

You don't have to pay a service, AND they have
FRS/GMRS radios built in so he can call for help if he
is able!

I just wish they made a base station style FRS radio.
Would be nice to have it turned on all the time in the
house because one never knows WHEN he's going to go
outside!

Thanks!

On Mon, 11 Dec 2006, Rodney Kraft wrote:

> Because of the restrictions on FRS radio, that's out!

Except for the FIRS RINO. GMRS by the way is better (more range), but requires the $80/five-year license where FRS is license-free.

> And because he's NOT a ham, APRS is out!

Not necessarily. If the controls are not user-accessible, then anyone can carry a tracker. It has to be under the control of a ham, which could be you. Doesn't mean you have to be physically present at the tracker package. Think about things like remote repeater sites, high-altitude balloon packages, etc...

> HOWEVER, I was told, by someone on this group about
> the Garmin Rhino 110! They are around $150.00 each
> and you need two(2) of them to work.

Careful there, as those are the FRS variety and therefore the range is very limited. Don't believe the range figures they give you in their product literature by the way.

> You don't have to pay a service, AND they have
> FRS/GMRS radios built in so he can call for help if he
> is able!

Yes.

> I just wish they made a base station style FRS radio.
> Would be nice to have it turned on all the time in the
> house because one never knows WHEN he's going to go
> outside!

They do. Keep looking and you'll find both FRS and GMRS base stations. GMRS mobiles too I believe.

I consider FRS range to be pretty much "toy" radio range. If you're sure he'll never wander more than say 1/2 mile and you have line-of-sight over the entire range, it _might_ work. I personally would rather have the extra security of the higher output GMRS radios, even though it would mean paying $80/five years for a license. That really isn't much.

Also: It might be useful to have an Xastir session running each time he wanders to record the pattern & timing. That might be very useful data should the high-tech solution fail and one have to resort to old-fashioned search techniques. If you'd like to go down

this path (Xastir/GPSman hooked to the base-station side radio) I
can probably help you there.

Phil,

I can only say for the Earthmate, which have and have used for a couple of years. But to make it work I purchased a GST-1 from Byonics.com to translate from the Rockwell output to the NMEA-0183 that is needed by most TNCs and TNC type devices.

Cheers,
Stan/KC7EHJ

That is correct, it is the 9 pin serial. I guess I should have made
that clearer in my post.

So? run an APRS locator on a business band channel.

You said "He lives on a 13.5 acre farm with LOTS of
tall Christmas trees."
I'll bet he would qualify for an agricultural or forestry license.
(note to the nit-pickers - not forest service - there are business
channels available to tree-growers)

Drop an email to Garmin. Ask for one. The more requests
they get the sooner it will happen. Wouldn't it be cool if it
had a serial cable to talk to a PC that could display a map?

I got some input from a friend after I posted my question. It seems that the Earthmate doesn't put out the right data. The Tripmate does. I just picked up a Tripmate for $13. I found the information for the required mod. Looks like a piece of cake. Also, I'm told the TinyTrak3 puts out 5 volts so I'll even have power for the Tripmate.

which model earthmate are you referring to? the newer USB outputs NMEA and the older serial version can with the attachment of a converter.

73,
rich, n9dko

I got some input from a friend after I posted my question. It seems that the Earthmate doesn't put out the right data. The Tripmate does. I just picked up a Tripmate for $13. I found the information for the required mod. Looks like a piece of cake. Also, I'm told the TinyTrak3 puts out 5 volts so I'll even have power for the Tripmate.

I'm referring to the older Earthmate. The one with serial output. Yes there are converters, I found one. I can't remember for sure but it seems like they went for about $45. That's a lot for an adapter especially when you can get a Tripmate for $13. The Tripmate will only require a couple of jumpers to work with the TinyTrak3.

Don't assume that the TT regulator will have enough headroom for anything.
This is one reason the later model TT3 came out - the one with the 1
amp regulator.

One conversion I saw added a regulator inside the Earthmate (which made
it a 12v device).... A three conductor cable... +12, ground and data out.

3965. Path settings

Yahoo group: APRS (1998 — 2006)

Topic: 3965 Message: 3965

Hi
I am having a problem with HF APRS. My station is not being recognised by local stations, selectivly. By that I mean some stations can recognise my station, others do not. In particular, a local gated to Internet refuses to recognise my station.
As well, I notice that my station will also not recognise some stations. I can see them on my monitor but they will not appear on my station list.
Question is, is there any path settings or settings in the programs that will have this effect? How about the settings of the station I am receiving? I am using both UI-View32 and AGWTracker with the same results.

TIA Graeme zl1gbb

OK. Well, I might have found the answer to some of my problems. Only
some I hasten to add. I have changed computers. Previously, I was
using a laptop. One thing noticeable about the audio from the laptop
is that there were 'breaks' in the sound. Did not know what was
causing these but I did not think that they would have any effect. It
look as though I was wrong. I am now using a desktop computer and I
am now being recognised by the local Igate station 100% of the time.

However, this still lewaves the matter of the 'missing' stations
that my previous post was about. They are still 'missing' from my
monitor. So any ideas?

Hi
you can forget my previous posts. Turns out ALL my problems were due
to the soundcard on my Dell laptop being faulty.

cheers Graeme zl1gbb

Phil,

My wife, K7MGO, and I now are fulltiming in our RV and we send APRS messages so our family and friends can keep track of us and contact us if needed in an emergency.

Many of my ex-co-workers at Coos Bay Police follow us too. We use a Tiny Traker III attached to an Icom radio which is mounted in the RV. By using the TT3 we can take it out of the fifth wheel and put into the pickup or the Subaru. All have Icom 2720's mounted in them. We can operate voice on one side and APRS on the other.

I also use other means to get positions sent while on the move. I use AIRMAIL/Winlink over HF to send position reports if I am not in reach of an APRS digi. When we are not mobile for a period of time and no digi is around I send my position by telnet.

give me a shout at NB7O@... and I will give you more info.

73 de kevin/NB7O

You can track us at:

Hello All,

I have for sale a PK-232MBX with the lastest firmware v7.2 which supports Pactor 1

The unit works great.

I will include a serial cable, and power adapter

I'm asking $100.00 plus shipping from zip 37931

Reasonable offers or trades will be considered.

73s,
Jonathan/KC8CPW

3970. Connecting a vertified user with Mac/WinAPRS with APRSD

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-15 03:21:16 UTC
From: Josh Housey
Topic: 3970 Message: 3970

Hi All,

The name here is Josh (AB9FT) in Sheboygan, Wisconsin which is roughtly 50 miles north of Milwaukee along Lake Michigan.

What I am trying to do is the following:

I have a Mac/Windows PC that is only is connected via the LAN network that I want to use Win/Mac APRS to transmit my position/receive the activity on 144.390.

In the shack here, is a Linux computer running APRSD. I am not using APRSD for what it was truly "intended" to do, but rather to get my Mac/WinAPRS out on RF and be able to see everything that the shack computer is seeing.

With very little configuration done to APRSD, mostly defaults, and a "port" setup in Mac/WinAPRS to connect via TCP to APRSD in the shack computer, I am able to connect. I can see all activity and comes up on the map, but I am getting "unverified user, etc" from APRSD. I completely understand that, as "apparently", Mac/WinAPRS aren't sending the necessary information to be "verified" as in sending the "user ab9ft-15 pass ...." I know that is it, because I can use straight telnet from any other machine and do the following above and get verified without Mac/WinAPRS. I have Linux experience and I have already accomplished it with Xastir. It makes this extremely easy, as there is an option to pass the necessary information along to become vertified by APRSD.

Right now, I am stuck on, if it is possible, to get Mac/WinAPRS to send information to my APRSD to allow it to be able to be verified. The only other way to possible get this done without needing to have Mac/WinAPRS to send anything, is to configure APRSD to have somewhat an "anonymous" method of logging in. As far as I can possible see I do not intend on using APRSD for the full igating features, like I mentioned above, using it only to get a network PC with an APRS client version out to RF and see everything on RF.

I know I have alternative clients out there, figuring everything and going with Xastir/UI View. First of all, I have no use for UI-View (Windows) and if it is going to a PC, it will be Linux and will be Xastir. But my Mac, that is another matter. I am trying MacAPRS first, just to see if I can do it. It is a decent program for the Mac and could accomplish everything. If I really have to go to Xastir with Mac, I can, but it is going to be a long, process, as I have to do with installing X, along with a window manager, and then everything for Xastir and finally itself. I have instructions on how to do it and

it can be accomplished with some time.

Any suggestions will be appreciated and those with a understanding of APRSD/setting up TCP connections with Win/MacAPRS to help me with this.

You can leave a response on the group thread here or if you want to go direct, use either ab9ft@... or the address I am using now.

Thank you for reading.

I remember something about being able to send a message to the server, but can't recall details. It'd been quite some time since I ran APRSD.

Is your MacAPRS registered? If not, that's the problem. I'd think it would send the stuff along automatically if it were registered.

As far as Xastir, we have quite a few people running it on OSX. Subscribe to the Xastir list (if you're not on there already) and people would be happy to help you get it set up if you have difficulties.

There are people talking about coming up with an OSX binary as well, but that would still involve installing X11 on your Mac first I would think, unless someone can statically compile all the necessary libraries as we did with the Xastir LSB binary.

I've just recently begun to seriously look into getting APRS started for my home and mobile setups. Being new to the whole deal, I need quite a bit of advice. I know only some of the very basics. Anyhow, here goes...

In my house I have an extra computer I will be using to assist in running the APRS station. I'll be using the 32 bit version of UI-view and PmapServer6 (maybe version seven later) as my software. I also have a weather station and I'd like to transmit that data over APRS. Being a college student I don't have a lot of money to go into this, so will likely not be buying a big fancy TNC for all of this. So here it is again: desktop computer, weather station, UI-view 32, some kind of TNC, and the radio. What do I need to know for this? Any cheap TNC ideas?

The mobile setup gets complicated. In my truck I'll be using an APRS dedicated radio, GPS, and a cheap TNC (I guess). No computer for this deal, just for using it as a tracker, at least. Help, please?

Now, here's what I've confused myself over every time I've thought about it. As a mobile storm spotter, APRS would be extremely handy. The above setup is the same except that a computer would be added, but the computer has ONLY USB ports, not serial connections. That way I'd be using the GPS as a tracker, and to also display my location on a weather software program I have. Is there any way I can have a setup that allows me to easily add or remove the computer as necessary for storm spotting? Being able to use the APRS system without the laptop is a must. Please, I really need help on this one!

I've been able to learn quite a bit about APRS lately, but there's so much to getting a setup going I'm getting nowhere. All help is greatly appreciated!

Well, you could go with AGWPE, the non-licensed version, which
allows you to use your computer's soundcard as a TNC.

You could also try a TNC-X KISS-only TNC, which is what I run at
home.

Up and coming TNC's which would fit the bill for cheap would be the
TinyTrak-4 and the Tracker2, both in beta-testing right now. I have
some proto tracker2's on hand and love them.

If your home station will be running on Windows then UI-View is a
reasonable choice. There are quite a few others, and you can even
run Xastir on Windows these days under Cygwin, Microsoft VirtualPC,
or VMWare Player. Note: Nearly any post you see from me will
mention Xastir in some form or another, because I'm involved in the
project. If you're a Unix or Linux user, it's an extremely viable
choice. And free.

As far as the computer with only USB, there are USB TNC's. One is the TNC-X with the optional USB, the other I know of is the uTNC+. The uTNC+ can function as a tracker, a digipeater, a bidirectional TNC, so it might be a good choice for you.

Another option is to use USB->RS-232 converter cables, which are relatively cheap. These vary greatly in how well they are supported by the OS, and how well they support various handshake signals and timing. Your mileage may vary on these.

A KPC-3+ TNC may also work for you, as it can digipeat and perform as a tracker, while connected or not connected to a computer. With this option you get NMEA strings out in tracker mode though, which are extremely long. If I were you I'd shoot for something that put out either Mic-E packets or Base-91 packets, which are both quite short. It helps you to get more of your packets received by others.

I'm involved in SAR, and so want a system similar to what you're after, except I don't need the weather stuff. I'm going with the Tracker2, which allows me to unplug the computer at any time yet still have the tracker/digipeater be fully functional.

Please see my APRS Client Capabilities Chart link which is listed at the URL below. I try to keep tabs on the capabilities of the various APRS clients there. Any input for keeping the chart up-to-date is appreciated.

Good luck on your learning! You're correct that there's a lot to learn. Lots of conflicting info out there as well.

Matt,

In my mobile I do exactly what you say you want to do. I run with or without my laptop. An inexpensive way to do that is with a TNC-X with the trackerx module and the USB connection. Check it out at www.tnc-x.com <http://www.tnc-x.com/> . The GPS stays connected to the TNC-X and then the laptop can run ui-view and be connected to the tnc-x Via a usb cable. It works GREAT.

Greetings All -

The help a number of you have been providing in another thread has encouraged me to ask this. I have been following that tread, but frankly most of it is above my head. I'm not really "into" APRS but have been following the group for a while.

I would like to give my Dad the pieces that he is currently missing of an APRS transmission station. And I would like your help/suggestions.

He currentlyhas:

1) A Pharos Gps-360 that comes with, or is associated with, Microsoft Streets & Trips 360. This is a USB only GPS receiver that is meant to plug directly into a lap top USB connector.

2) Kenwood model TH-G71 HT.

I'm pretty sure that as of last year there were no APRS TNCs or interface devices that could talk to the Pharos Gps-360. Has that situation changed? Is there any way to interface the USB based Pharos GPS-360 for use in APRS?

If not, what is your recommendation for a low end GPS/TNC combination that could be interfaced to the TH-G71 HT to report the position of a mobile station.

Thanks

From: Scott Miller
Topic: 3976 Message: 3977

There's presently no way without a PC to use a USB-only GPS receiver. As soon as a suitable embedded host controller chip hits the market I hope to change that, but even then it'll require custom drivers for each type of GPS receiver.

Subject: [APRS] The gift of APRS

Greetings All -

The help a number of you have been providing in another thread has encouraged me to ask this. I have been following that tread, but frankly most of it is above my head. I'm not really "into" APRS but have been following the group for a while.

I would like to give my Dad the pieces that he is currently missing of an APRS transmission station. And I would like your help/suggestions.

He currentlyhas:

1) A Pharos Gps-360 that comes with, or is associated with, Microsoft Streets & Trips 360. This is a USB only GPS receiver that is meant to plug directly into a lap top USB connector.

2) Kenwood model TH-G71 HT.

I'm pretty sure that as of last year there were no APRS TNCs or interface devices that could talk to the Pharos Gps-360. Has that situation changed? Is there any way to interface the USB based Pharos GPS-360 for use in APRS?

If not, what is your recommendation for a low end GPS/TNC combination that could be interfaced to the TH-G71 HT to report the position of a mobile station.

Thanks

You won't find a TNC that will talk to a USB GPS. The host end of a USB connection requires some serious horsepower to accomplish, so you typically won't find USB host-side connections in an embedded device.

There are software shims that can be used on a laptop to provide GPS data to more than one bit of software, so that might be a way to go: Install the shim, bring up the mapping program he normally uses, bring up the APRS program, run the laptop in the car if you want to go mobile. This is a big pain though, having to run a laptop all the time in a car.

An OpenTracker-1 kit ($29 w/o case, more with case or assembled), plus a Deluo serial GPS or a Garmin GPS-18 GPS. See this link:

<http://www.argentdata.com/catalog/>

He manufacturs and sells the OpenTrackers, plus has these two types of GPS for sale as well. Watch the power requirements on the GPS'es. At least one model of OpenTracker has a larger regulator that can be used to supply 5V power to the GPS.

I'd recommend that he run an external antenna on the vehicle and perhaps 20W or so. A handheld on a rubber duck antenna typically doesn't cut it, unless he's right in the middle of a big metropolitan area. Even then the low-power signal might get knocked out of the ring by higher-power mobiles if the channel is quite busy. If there are lots of empty time slots then he might stand a chance with a handheld + external antenna.

I run medium power out of a Kenwood TM-261A mobile rig to a 1/4W hole-mount antenna on the roof of my Jeep and it works well. I'm currently running an OpenTracker-1 but I have some Tracker2's that I play with from time to time as well (same vendor but Tracker2's are still in beta-test).

Ok, now "I" have a questions!

Just what does the "Open Tracker" do? I'm VERY new to APRS, in fact I haven't even started collecting the equipment to do APRS!

I'm trying to gather as much "Useful" information as I can!

Basically I need to know WHAT kind of equipment I will need to do APRS from my bicycle! Not really interested in operating from a vehicle or my home. Just my bicycle!

ANY information would be helpful!

The standard OpenTracker kit is now the OT1x version. It has a 1 amp regulator, so powering most GPS receivers isn't a problem. The kit is $32 including the case. As of last week the original OT1 is available by special order only - I'm out of the PCBs and since the OT1x has been more popular it didn't seem worth carrying both. I may actually get one more batch of boards made to use up the remaining cases and to have some on hand for replacements. If you happen to pick up an OT1 somewhere, check the PCB revision. Revision 4 has a 250 mA regulator, which is plenty for the Deluo or GPS 18.

3981. RE: [APRS] The gift of APRS

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-18 17:08:14 UTC
From: Scott Miller
Topic: 3976 Message: 3981

The OpenTracker (like the TinyTrak and a couple of other similar projects) is a transmit-only APRS tracker. It's not a full TNC, and can't decode incoming data - it can only see that the channel is busy to avoid transmitting on top of someone else. Generally, you'll hook it up to a computer to configure it (and sometimes to install new firmware) and after that it's a standalone device that goes between a GPS receiver and radio. It'll also connect to some types of weather station in place of a GPS receiver and transmit weather data, and it has some telemetry capability.

So for your bicycle, you'll need a GPS receiver (I think the Garmin Foretrex is popular for bikes, don't have one myself), a tracker (like the OpenTracker), and a transmitter. And a power source for all of that, of course. That's always annoying - most ham rigs don't put out enough power to supply both a tracker and GPS receiver. I usually run a pack of AA batteries for portable apps.

> Just my bicycle!

It's a transmit-only APRS TNC. You hook it up to power, a GPS, and a radio. Hook the radio to power and an antenna. This gives you a transmit-only APRS setup in a small package. This particular unit is flashable from your PC and open-source software, so you can reflash the unit with the latest firmware whenever you like.

Other similar units are the TinyTrak-I, II or III, except that for these the firmware is fixed until you buy an updated chip from Byon each time.

When you get to the Tracker2, also from the OpenTrak guy, you're into a TX/RX TNC. Same for the TinyTrak4 from Byonics, it's a TX/RX TNC. Both of these units are still in beta-testing.

For a bicycle, consider running a 1/2 wave antenna which will allow you to run without any ground plane. Some people run fiberglass antennas for this, some run homemade dipoles. I think I've also heard of people running J-poles made out of TV twinlead.

Thanks a lot Scott, Curt -

1) The link on the 1X detail page took me to the PCB rev 4 users manual. I assume the info there is correct for the 1X. Is it?

2) I see that both the Deluo WAAS and Garmin 18 LVC are offered for sale on the same site. I assume they are both compatable. Given that, why should I choose the more expensive Garmin?

3) When connected to the computer for configuration/firmware changes does it pull power from the computer or does it need power on the radio connector?

4) It looks like in order to provide the missing pieces for my dad.... I would need to get:

OpenTracker 1X
9 pin D type male connector for wiring to the radio and power source (
6.7to 30 Vdc)
9 pin D type female connector for wiring the GPS Receiver
GPS Receiver (Deluo or Garmin discussed above)
Some as yet un-determined cable for wiring to the mic input of the HT
Some as yet un-determined cable for wiring to a power source.

That sound right?

Thanks again,

Tom

Yeah, the rev 4 manual covers the software and operations. The 1x addendum has the hardware-specific stuff for that version. Now that I'm discontinuing the rev 4 it's probably time to merge it all into an OT1x manual.

Advantages of the Garmin include operation above 65,000 feet (important for high-altitude balloons, and the primary reason I carry them) and a threaded mount. Personally, I use the Deluos for everything but balloons.

For configuring and loading firmware you'll need an external power source. I've looked into it, but you just can't reliably draw enough power from the serial port to handle the flash programming. Sometimes I'll use a 9-volt battery clip soldered to a DB9 connector for power during programming.

As for the cabling requirements, I'd suggest getting the Deluo and the DB9 adapter for it. It's easier and cleaner than wiring one yourself, and doesn't void the factory warranty. The Garmin's factory warranty isn't affected by cable changes. So yeah, you need the GPS, DB9 adapter, OT1x, and (assuming you don't have one) a DB9 male and connector shell to wire up the radio side. Or you can talk to Jason at RPC Electronics and get a pre-assembled cable for your radio.

3987. Two VHF Antennas

Yahoo group: APRS (1998 — 2006)

From: Phil KD7ZD
Topic: 3987 Message: 3987

I want to start using APRS mobile with a second radio but I'm concerned about the receiver in my FT-857D.

The roof of my pickup is only so big and two antennas will need to be within 2 1/2 to 3 feet of each other. I will be using a 25 watt transmitter for APRS. With antennas that close am I going to wipe out the front end of my FT-857D if I use it for VHF also? Does anyone have experience with two antennas this close?

mount one on trunk. u could stack the antennas one on top of the other with
out any interference to each other. Cut power to 10 watts, plenty unless u
are in the boon-docks

No trunk on a pickup and I do live and travel in the boon-docks. It may be that I will need to reduce power. That's why I came to this group, to find out what others are doing.

I can live with desense, the question is will the front end of my FT-857D survive. How much power are you running on APRS?

I mounted a 1/4 wave VHF antenna under my SUV, kind'a like a curb feeler. Don't laugh, it works fine & provides adequate seperation. I had a Camaro for a time and didn't want any antennas showing and used this method. A little more picket fencing, but worked like a champ.

I don't use APRS just yet, but I do use VHF voice quite a bit and I have two radios in the truck. I drive a Ford Ranger and both antennas are on the roof, I think with only fifteen inches or so between them. I've never noticed any desense between the two radios and both have survived the RF getting into them. I don't have a way to accurately measure how much RF is really getting into one radio when the other is transmitting, but using a SWR meter I had between one quarter and one half of a watt getting in one while transmitting with fifty watts on the other. I believe that's way too much RF getting in, but there's little I can do.

I don't know about the radio you mentioned, but other Yaesu's I've had experience with have had no trouble with the RF coming in. Obviously using as little power as possible is the best option, but I get the feeling you'll be okay. If I remember correctly you have more space to work with too, which is great, as long as you still have enough roof space around the base of the antennas so that they have a good ground plane.

I'm running a Jeep Cherokee with a 50W rig + opentracker in an ammo-can going to a 1/4 wave whip right above me (right near the dome light but of course on top). I run a 5/8 wave antenna on the front hood in front of the driver's position a ways, hooked to my 2-meter voice rig. I get desense on the voice rig whenever it transmits, but am running Base-91 compressed packets and as short a TXD as works. This generally keeps the desense down to about one word (on the voice rig) so I can usually carry on QSO's without requesting too many repeats.

Another factor may be that when I'm doing voice QSO's the APRS rig may hold off transmitting. I haven't investigated this to any degree but it seems likely.

I'm running medium power on the APRS rig (probably 20W?) and low power usually on the voice rig. I've run with this scheme for several years, but have changed from a TinyTrak-II to an OpenTracker and have gone down in power on both rigs for various reasons.

Topic: 3987 Message: 3995

In my sedan I had terrible desense problems into my broadcast radio and scanner when my 2M APRS radio transmitted from the center of the trunk. Low power helped but didn't cure the desense problem and even here in the Los Angeles area 5 Watts into a dual-band antenna just didn't work for me on APRS.

I reluctantly drilled a hole in the center of the roof and used a duplexer to put an Antenex Phantom Elite (http://www.antenex.com/index051206.htm) VHF antenna up there. This antenna looks like a GPS/telematics antenna that comes as original equipment on modern cars and Antenex makes a 144-148MHz model just for the ham band. Since people will ask, I use the ETRAB1440 in black but there is also the ETRA1440 in white.

The other port of the duplexer feeds the 440 version (ETRAB4303) on the left side of the trunk and the 470-490MHz version (ETRAB4703) opposite it connects to a public safety radio. These UHF ones look like the blade-style antennas one sees on newer GM trucks and SUVs and they work exceedingly well, in my opinion better than a quarter-wave. If you have had a negative experience with previous "low profile" antenna designs (as had I) then you will be surprised by this design (as was I). I have copied mobile simplex traffic well from 10-15 miles away. I liked the Phantom Elite so much that I've ordered them in VHF, UHF, and 800MHz for City vehicles and our plan is to make these our new standard

And no, I don't have any relationship wtih Antenex other than being a long-time fan of their antennas.

Topic: 3996 Message: 3996

Hey all-

I've been out of touch for a while as far as hamming goes (work, family, etc.) and I've changed my call to W0RMT (from KB9WVG). Recently though, I've been getting back into APRS both mobile and portable (the home WX/APRS station is down until I get a new PC).

The last two times I've been skiing I've taken the APRS setup with me. It consists of a D-7a and a Garmin Foretrex 201, all mounted neatly on my backpack. (I always ski with a pack to carry water, food, climbing skins, layers, etc). Anyway, Last week I got some packets into the APRS-IS from Vail, and tomorrow I'll run the setup from Breckenridge. Look for W0RMT-7 ski mobile. I have been using the hiker icon, but I may switch to the snowflake (there is no skier icon listed in the spec). I monitor 146.52 while skiing. Send me a message if you see me on and we'll see how the setup works for messaging while on skis above timberline :).

3997. Winter Field Day

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-23 18:44:08 UTC
From: Jeff
Topic: 3997 Message: 3997

http://www.spar-hams.org/contests/winterfd/index.php?pg=2

Society for the Preservation of Amateur Radio
The SPAR Winter Field Day
Purpose: To encourage emergency operating preparedness in the winter.

When: 24 hours from 12:00 noon January 13, 2007 to 12:00 noon January 14, 2007 local time. Station set up may begin no earlier than 8:00 AM local time on January 13, 2007.

Bands: All bands, except 12, 17, 30 and 60 meters.

Modes: Any mode.

Categories:

a) Number of operators: 1, 2, Multi
b) Site: Indoor, Outdoor, Home

For example, 2 operators at a remote campground would be 2O, 1 person at home would be 1H, 5 club members operating from a community center would be MI.

Exchange: Callsign, True RS/T (not all 599), Category, local outside temperature (with F or C). For example 1 person from a campground where the temperature is 28 F might send "KX5XYZ 449 1O 28F" or "KX5XYZ 449 1O -2C"

QSO Points: 1 point per QSO, irregardless of band and mode. The object is to be able to communicate and in an emergency it doesn't matter what band and mode is used. Busted exchanges will be penalized by 1 additional point for each missed exchange or callsign.

Multiplier: Count 1 multiplier for each mode operated per band. For example, operating CW and Phone on 80, 40, 15 and 10 meters, CW and PSK31 on 20m, FM simplex on 2meters and satellite on 1.2 GHz would be a total multiplier of 12.

Bonus: Count 1000 points if commercial power is not used, 1000 points if outdoors and 1000 points if not at home. For example, operating outdoors in your backyard without commercial power would be 1000 + 1000 = 2000 points (outdoors, no commercial power), while operating from a campground tent using commercial power would be 1000 + 1000 = 2000 points (outdoors and not home).

Final Score: QSO Points x Multiplier + Bonus Points.

Logs: Logs should be submitted to "winterfd@..." by
February 15, 2007 to be considered.

Results will be posted on the SPAR website and included in The Roundtable. Pictures, description of operations and logistics are encouraged and welcome.

Definitions:

Location - the place where an amateur station is setup for the contest.

Home - operating from the place where an amateur station is normally established. If the station used in the contest is setup before 8AM local time, it is a home operation.

Indoor - operating from inside a building at a temporary location where amateur radio is not normally available, including community centers, etc. If it has a permanent roof and walls, it's indoors.

Outdoor - operating from remote locations with no permantent building, including campgrounds, tents, RV's, etc.

Band - the normal amateur band allocations recognized by the ITU, i.e. 160, 80, 40, 20, 15, 10, 6, and 2 meters, plus the UHF bands. To be counted as a band, at least 1 valid QSO must have taken place on the band during the contest. 75 meters counts as part of 80 meters.

Mode - CW, Voice (including SSB, AM, FM), Digital (including PSK, RTTY, and soundcard modes), SSTV, satellite.

Operator - Any person that operates the radio, keyboard, microphone or CW key, including logging assistance. This does not include non-operators, such as someone who brings food, but does not participate in operating.

Miscellaneous:

- All rules governing amateur radio must be observed throughout.
- The decisions of the SPAR BoD is final.

3998. APRS & Car Batteries...

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-25 14:37:23 UTC
From: Chris
Topic: 3998 Message: 3998

Cross posted here from another Yahoo Group I belong to (the D-700 one) since it seems relevant.

All, a few things I have found that help preserve Car Battery Life when using the D-700...

1. Turn the beacon rate down (20 - 30 minutes is fine for stationary situations); turn it back to ~5 minutes when you are actually driving). You don't need to be beaconing your position less than every 3 - 5 minutes when you're mobile unless you're doing SAR/Damage Assessment/Critical Transport/etc.

2. Turn the power on the APRS side down (low or maybe medium); most metro areas have enough digis that an APRS signal transmitted on LOW power will still do the job, especially when you are stationary. Also remember that Part 97 states that you must use the minimum power necessary to complete the communicatins.

3. Use the DIM display function (F-Dim, setting 4 or zero) to dim the display. This will make the radio "look like" it's off.

4. If you're going to be parked for more than a few hours, TURN THE RADIO(s) & GPS off... If you're stationary, there is no sense sending the same position report every time for 3 - 4 hours {see also #1}. It will take only a couple of minutes to re-aquire the GPS data once you turn things back on when you get ready to go. In most cases, it'll be running by the time you leave your street.

5. Put in a voltage sensing "kill" switch so that when the battery gets below a "critical" value, your radios are shut off but you can still start the car when you return.

6. Along the same lines, use a separate battery to power the radios and run a charge line from the main car battery with the same type of voltage sensing switch as I mentioned in #5 above.

Got mine wired to the ignition of the car so when its running it tracks. Plus I have a tiny trak wired to a kenwood 25 watt radio just for aprs with smart becon to allow for speed on the tx side. All in the trunk to get it out of the way with the antenna on the trunk. Main antenna is on the roof but it still gets a bit of desense every now and then. Any sloutions to this?

I'm using an APO2 from James Jefferson of APRSWorld fame. I think
he's selling the APO3 right now. I can't recall how it came now, I
think with unterminated wires coming out of the case. I added
powerpoles on there myself. I'm running two 2-meter radios, a GPS,
and an OpenTracker downline from it and never have to turn my radios
on/off anymore myself.

4003. TH-D7A connection to a Basic STAMP II?

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-27 04:06:50 UTC
From: Mark Ford
Topic: 3766 Message: 4003

Greetings all,
I'm trying to figure out how to design a flight computer for a scientific ballooning project. Any thoughts and advice welcome.

I have a Basic STAMP II, so I thought I would use that as the heart and soul of the system. I have a TH-D7A with a built in TNC which I'm borrowing, and I also have an old beat up Alinco unit which I was thinking of purchasing a Kantronics TNC for.

Basically, I'm trying to figure out how to get the Stamp II to send APRS strings to the radio for broadcast to the ground. Just as important, I need the Stamp II unit to receive commands and take action.

Any thoughts?

Thanks,

Mark KB1MSA

4004. APRS and Q constructs.

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-27 16:07:07 UTC
From: zl1gbb
Topic: 4004 Message: 4004

Can anyone explain this, please?

This is from Findu and is the data from my Igate. It is using a 'Q' construct in the form qAC. In other strings I have looked at, this is usually followed by the Callsign of the station. With this one, it is followed by the identifier of the Server (T2NZAA).

ZL1GBB>BEACON,TCPIP*,qAC,T2NZAA:=3809.27S/17615.57EnReceive only Igate {UIV32}

Got a feeling there is something I should be doing, such as supplyiing the callsign. Is this likely?

I wouldn't put the D7 in the balloon, if that's what you're thinking of. Too expensive and too power hungry. I used an old HTX-202 that I paid about $40 for. My flight computer was a prototype Tracker2, but they're not in production yet and at this point customizing it requires some programming in C.

If you want a TNC for your Basic Stamp to talk to, you might try the TNC-X. You'll need to have the stamp speak KISS, but it's not that hard. It's mostly just a matter of properly encoding the source, destination, and path callsigns, and handling the escape character.

Not counting the helium, I think my whole launch cost about as much as a D7 - radio, controller, cameras, balloon, housing, batteries, radar reflector, parachute, backup transmitter, and antenna included. Also, remember that you'll need to use lithium batteries to handle the cold. That's harder to do with some radios than others.

I am looking to make a small waterproof tracking box that I can take with me on little adventures that I like to take. Right now I have a VX5r HT that I want to use as my radio in this tracker. I also have a Garmin 76 mapping GPS. What type of TNC do I need to tie these things together to make this work? I have bee searching the net but I am lost as to what is small and what I need to connect it all together.

When I am not out playing in adventure world I would like to be able to hook the GPS and TNC to my FT-8800 in the car when traveling.

Please feel free to drop some ideas, websites or photos.

Never put anything on a balloon that you cannot afford to totally lose.

Besides, a D7A is too heavy and too power hungry.

From any altitude at all 1/2 watt is plenty, and 1 watt is serious overkill.
Don't forget you can use a upside down ground plane that
will direct your energy towards the earth below.

And the power source has to be lithium, anything else
loses energy as it gets cold.

Thanks for the help Phil.

I was looking at the link that was sent, and seeing so options I am looking at power needed to hit a receiving station in the areas that I like to visit the most. Is there a way to look in an area such as the area around my QTH for an example and see what the nearest receiving radio would be?

A small 5 watt ht and a tiny track with GPS would work well for this project and that way you're not out if the balloon takes a serious dive into the ground. Several 2m ht can be found on eBay for little or no money and the tiny track and GPS can be found on the web. Think the trackers here use an old radio shack htx-202 with no battery and the tiny track with gps.

Will do some checking to see if I can get an answer on that though.

Thanks for the info. We are using the TinyTrack and looking at the Opentrack/Tracker2 as well for a primary (eventually secondary) system. However the TinyTrack will not work for this application. The TinyTrack is downlink-only. It won't support uplinked commands. The TinyTrack will talk to a GPS, but I'm not sure it will talk to a BS2 microcontroller.

The communication between the radio and the microcontroller is key. Our balloon is just a vehicle. When we get this up and running, we will be flying experiments for high school and university students. We need a way for those experiments to send down data, and for students to uplink commands to the payload.

I'm all ears on the radio frontier.

Regards,

Like, zip=N1680 or zip=N-1680?
No. Both returns: "Stations Near -0" and a blue map with one DL
station.

oops! your not a USA station.
Try:
http://www.findu.com/cgi-bin/map-near.cgi?lat=24.5&lon=-81.2&cnt=20

Substitute your Latitude after lat= and your longitude
agter lon=

Jan,

If you change cnt=20 to cnt=100 there are quite a few
stations in your area. Not sure if the calculation is
mile or Kilometers.
http://www.findu.com/cgi-bin/map-near.cgi?lat=59&lon=011&cnt=100

The postal zipcode option only works in the USA and
possesions.Here is a look at my QTH.

http://www.findu.com/cgi-bin/find.cgi?call=KK5RZ-9&radar=***&terra=4&topo=8

Hi again;
The "cnt" obviously is a counting parameter. 20 -> 20 nearest
stations, 100 -> 100 nearest stations.

4021. UI-View32 and PK88

Yahoo group: APRS (1998 — 2006)
Date: 2006-12-30 19:54:53 UTC
From: radioman72001
Topic: 4021 Message: 4021

Hi

Currently, I am running UI-view32 using the sound card (AGWPE) as the TNC. But, I would like to get this to work with a PK88 TNC just to see how it works and then try to set up a portable station using it. However, I cannot seem to get Ui-view to talk to the PK88. Does any know how I should set this up in UI-view? I am using a serial cable from COM1 on the computer to a 9 pin to 20 pin adapater at the PK88. I have tried both with and without a null modem adapter, all with no effect.

I just plugged my pk-88 in, and used the pk-232 TNC Type setting in Comms Setup. Don't even try to setup UI-View until you establish communication with Hyperterminal. You may have to search for the right baud rate. 9600 is a common setting. Parity none, 8 bits and 1 stop bit are the other comm settings I use.

If you have a voltmeter, look for voltage on pins 2 and 3 of the 25 pin end of the cable. The TNC should provide voltage on one, and the computer on the other. If the voltage is on the same pin on both ends, use the null modem adapter.
